Chinese company Magic Ben is attempting to bring back Netbooks from the dead with its new Mag1 <https://digit.in/jan20-43>

Best budget laptops

Here are our picks for the best budget laptops that you can buy in India right now <https://digit.in/jan20-44>

by formatting the drive to FAT32 or exFAT, the latter being the newer and better file system.

So if you have an external harddrive that uses a USB 3.0 interface (Type-A or Type-C) and is formatted with exFAT, you can use it with practically any computer. So there is no longer any need to get Apple-specific hard drives for Apple devices. Which was my suggestion to my friend as well. However, the hard drive manufactur-

ers have also been working towards making amends. So why would you get these LaCie and G-Technology drives these days? Well a good number of models have a very rugged build. They're still using mechanical hard drives so a good fall while they're plugged in can still mess-up the internals of the hard drives. But they're more rugged than most of the other drives that you can buy in the market. So you can say that in a way, they're

still capable of demanding a price premium. Honestly speaking, I would much rather get an external USB 3.0 / 3.1 / 3.2 Type-C SSD which can handle much higher levels of mechanical shock, have higher speeds and are more compact. Those are definitely worth the extra cost and for those who'd prefer something economical, get an external NVMe SSD case and slip in any NVMe SSD. The combination works out to be much cheaper. 

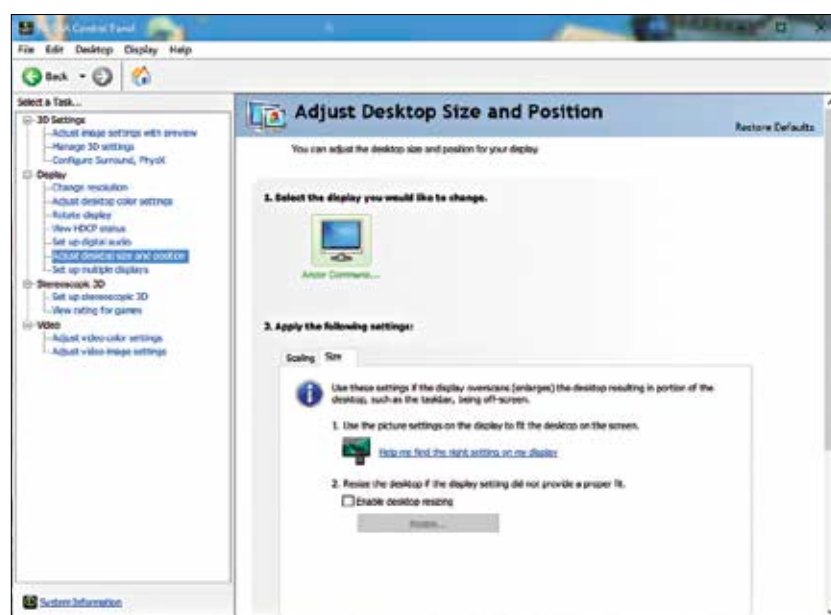

BUYING ADVICE

OFF TO THE RIGHT

Q Hi Agent001, I have been a loyal subscriber of Digit for a couple of years. I had purchased an HP Pavilion 15 laptops about 6-8 months back. Recently the image on the monitor has shifted to the right by about an inch and there is a black vertical stripe on the left side of the monitor. This does not happen all the time. Sometimes it is there and sometimes it goes away. I have taken the monitor to my neighbour and he could not fix it. It becomes problematic to close applications after I have started them because I cannot click on the 'X' button in the top right corner of the window. So all my applications are always running and the PC becomes very slow. Please help me fix this.

—P. Moolchand

A Hey Moolchand, There are a couple of reasons why this might have happened. Honestly, such an offset automatically creeping in is something we've never heard of till now but we can do a few things to sort it out. Since you mentioned that this HP laptop was purchased recently, it would still be within warranty so you can always try for remote support. Before you reach out to support, here are a few things you can try to solve this peculiar problem. First check the graphics settings panel if there's some option that

NVIDIA Control Panel - Adjust desktop size and position

may allow you to compensate for the offset. If your computer is powered by Intel HD Graphics then you can open Intel Graphics Control Panel and navigate to the resolution option or you could simply use the Windows Graphics Settings panel to do the same. Drop the resolution to something that's not 16:9. Example - if you are on a 1920x1080 resolution monitor, switch to 1680x1050. This will reduce the width of the display in such a manner that you have black bands on either side and your entire display should be viewable. Now head to the support page of your laptop and download the latest graphics driver for your display adapter. The laptop manufacturers make slight modifications which result in the generic driver package not installing

properly so you have to get the drivers from the manufacturers website in such cases. Install that and see if there's been any improvement. If not, get the generic drivers and give that a go. Do ensure that you are picking the appropriate driver package. There usually is a DCH and a standard package. Most devices will require the DCH package. If your laptop has NVIDIA graphics then the 'Adjust desktop size and position' panel has a "Size" option which can help fix overscanning problems. Simply follow the instructions and resize the desktop to sort things out. You will have to undo the resolution change that we performed earlier before completing the resizing operation. If these don't help, then talk to your laptop manufacturer's customer support.
