

en. However, we should never ignore the human touch, because AI typically sucks at human-EQ (emotional quotient) and thus cannot develop things that humans can relate to. Not yet at least...

If you're a digital marketer who wants to rise to the next level with SEO understanding, there are several free SEO certification courses you can do online. However, some of the best SEO certification courses online are paid such as Digital Vidya, who is Google and Microsoft India's official SEO training partner. Meanwhile, there are also training courses available across several cities in India such as PromozSEO, LIPS India, The SEO Training Institute, and more.

If you're vying for an SEO job, HTML and static web creation abilities are integral. Don't let these intimidate you

Check out these SEO tools:

- Answer the Public
- Ahref's Free Backlink Checker
- Beam Us Up
- Yoast SEO
- Keyworddit
- Hunter.io
- SEO Web Page Analyzer
- Responsive Design Checker

since you will, once again, find a cornucopia of courses surrounding these online and around your area as well. Creating plugins and sitemaps for your website are also other important skills you must train yourself in. Most importantly, one needs to be flexible and willing to learn new things, given how fast things can change in the SEO world.

Even if you do not work in the SEO field, SEO training can be very beneficial

indeed, because most companies hire external SEO 'experts', and find themselves needing someone who works within the company to interface with aforementioned experts. Sometimes, companies need a trusted employee to tell them if the 'experts' are indeed experts, or just another of millions of hacks who fill up the SEO scene in India.

VIDEOGRAPHY

Whether you believe that AI will leave everyone jobless, or think that AI will create more jobs than it takes away... there is one thing for certain, jobs are going to change, and all of us will need to adapt to those changes. Creative jobs are considered to be safe bets, because a general intelligence AI that can truly mimic a human's brain and rival its creativity is still a long way off. Couple human creativity with the ever increasing shift away from text (online) to video, and you can see why you will need to develop that skill. In fact, AI is already trying its hand at making videos for you. If you use Google Photos as a storage for your pictures, you will already find the assistant making videos for you out of those, and the odd one is not terrible. Thankfully, most of them are horrific. The music is often tacky and out of context, the images are rarely flattering, and there's just no storytelling whatsoever.

Videography is going nowhere though, and in fact, AI will help you create the videos you want, and take over some of the more mundane tasks, leaving you to showcase your creativity. Most of us, however, don't know the first thing about editing videos, and are scared to try and learn, because it just seems too complicated. And let's face it, it's not just video professionals who need to know this. Even if you just want to be an average netizen on social media today, you need to be

putting out video content. Even business networking is moving to video, and even basics like learning how to light a room when on a con call with clients or bosses from abroad, etc, can leave a lasting impression, and we need every edge we can get.

Plus, traditional video producers have typically done one or two of the jobs, so we used to have one person shoot a video, another set up the lights, someone else for props, and a fourth to edit, while a fifth does basic effects or tweaking... no one has the luxury of appointing five people and paying their wages anymore. Instead, we're almost at a situation where a master-of-all-trades is being sought (as opposed to a jack-of-all-trades).

There is also a huge demand for video producers who are subject matter experts. For example, if you work for a car company, you're going to want a video producer who knows how to shoot cars, and who understands your needs. This will obviously be very different from a food company, or an accounting firm, etc. And let's face it, everyone these days has video demands! Who would understand your company better than

you? And if you had those capabilities and used well-created video for the company, or even used video in presentations... you are already at an advantage over others.

A video producer must be able to manipulate the camera in its entirety. This means being well-versed with concepts such as lighting, composition, background, colours, contrast, focus and more. Sound quality is also something videographers need to be mindful about under all circumstances. However, to take yourself one

Great online videography courses:

- Larry Jordan courses
- Inside the Edit
- Udemy video editing courses
- Pluralsight video courses
- LinkedIn Learning
- Skillshare
