

SHOWCASE

GLUON

GLUON is a modular collaborative robotic arm which can perform an array of complicated functions without the usual bulk and exorbitant price tag that comes with other innovations like this. It possesses an integrated motor, drive, encoder, and reducer, all inside the actuator. Designed with INNPOS' latest QDD SCA Lite series smart actuator, the GLUON can perform tasks with nearly human-like flexibility. This is possible due to the integrated motor we spoke

of above, as well as optimised algorithms.

The SCA's position, torque, velocity and impedance can be controlled directly without a need for additional components that pile on the bulk. The robotic arm can perform actions such as impact resistance, gravity compensation and collision detection using its SCA without any fragile sensors. GLUON is extremely fast and accurate as well, and tests show that the arm can even perform intricate tasks such as threading a needle. Customers have access to multiple swappable end effectors such as a suction cup, universal ball gripper, micro servo gripper and an

electromagnetic head. These can be switched as per your need or experiment. The GLUON is even capable of handling heavy loads, with a peak load capacity of 1 kg. Users can connect to GLUON using their PC (Windows 10/ Linux), Mac or even a Raspberry Pi. The modular design means that the build and assembly are extremely customisable and the number of axes (4 or 6) present is up to the user.

GoDice

Want to inject a bit of tech into your tabletop game night sessions? GoDice does just that. These are 'smart' or connected dice that eliminates the need to write down points or calculate scores in board games and RPG games. The dice connects to your smartphone and the data collected by them automatically sync to the accompanying app. All you need to do is roll the dice, tap your decisions (if you're playing something like D&D) and then watch the outcomes or the scores in real-time! Even complex RPG calculations, such as multiple dice and battles, are processed instantaneously and you can stick to focusing on the story and your strategy. As of the launch, GoDice is compatible with a total of 10 popular games including Yatzy, Ludo, PokerDice, Unlucky Sevens, etc. and you can even create add games using the API. It comes with an array of additional features such as group play, real-time stats and tips, tracking the speed of your game, online gameplay and shells for RPG games that encase the regular GoDice.

How is all this possible in the tiny form factor of a die, you ask? The engineers who have created GoDice have expertise in packing tech in small packages. GoDice encapsulates an inertial measurement unit, Bluetooth module, smart sensors to track activity and a supercapacitor that powers the dice. The GoDice can be charged in their carrying case. Stack the dice on top of each other inside the case and witness the mind-bogglingly rapid charging. We're not kidding, 10 seconds of charge will net one whole hour of connected gameplay!

inCharge 6

Termed the 'Swiss Army Knife of cables', inCharge 6 is a keyring cable that has the ability to charge all your devices. Yes, all of them. Apart from charging your devices, inCharge 6 also allows data transfer between two connected devices. The device houses a USB-C and a USB input on one side while the opposite side features a USB-C and Dual Micro-USB and Lightning output. You can even steal some power from a friend's phone if you're running low on juice! The inCharge 6 is

made out of zinc-aluminium alloy and the creators performed some pretty extreme tests (such as driving a car on it) to assess its durability. The cable even features a high-grade N52 magnet and an anti-slide system which prevents you from losing it easily. There's also an inCharge 6 Max variant which features a 5 feet long cable to ensure some insane mobility. It comes in three colours right now - Mercury Grey, Moon White and Saturn Gold. It's a nifty little device and users can forget about carrying a variety of cables for their numerous devices and just make do with one compact keyring cable (or the longer Max variant).
