WHAT'S NEW

Google releases high res map of fruit fly hemibrain connectome

Complex systems can be studied by exploring the connections between the parts, known as the network. Sociologists study social networks, and search engines study how sites link to each other as a basis for their rankings. Similarly, neuroscientists can study the connectivity between the neurons in a brain, known as a connectome. Google has released a high resolution map of all the connections between neurons in the brain of a fruit fly (*drosophila*). The resulting map is the highest resolution synapse resolution map of

neuronal connectivity that has ever been created. To reconstruct the brain in 3D based on data collected from ion beam scanning electron microscopes, Google

developed a new AI technique called flood filling networks, based on recurrent neural networks. The development has advanced the science of neural interconnectivity, known as connectomics by an order of magnitude. <https://dgit.in/flybrain>

How technology is transforming oral hygiene

At CES, companies showcased a number of smart toothbrushes, including one that uses charged molecules dispatched from a radio frequency generator, a toothbrush that identifies 16 different zones in the mouth and grades them with emoji, another toothbrush that uses optical sensors to measure plaque buildup on the enamel, and a toothbrush that tracks the length of time you brush for, and smiles

encouragingly when you go beyond the recommended period. Toothbrushes also use motion and pressure sensors now. However, toothbrushes are just the tip of the iceberg

on all the tech coming up now focusing on oral hygiene. There are dental floss subscription services, LED arrays that whiten the teeth, and consumer grade smile aligners, which traditionally required an expensive visit to the dentist. One of the reasons for all this focus on appearance is suspected to be the advent of social network platforms, and the nature of the internet in its current state.

Ikea 2.0

Ikea is acutely aware of its former missteps in technology (including an unbranded TV with TCL), and is entering the smart home space by focusing first on the furniture instead of the technology. They are calling the initiative Home Smart, and have the scale to take on the Tech Giants.

Microsoft forcing Bing

Microsoft is bundling a chrome plugin with Office 365 installs, that forces users to switch from Google to Bing as the default search engine in Chrome. Users have to manually or programmatically remove the plugin to reverse the change.

The secret history of facial recognition

At the advent of efforts to give computers the capability to recognise human faces in the 1960s, shady companies fronted by the CIA funded the initial efforts. Track how the technology became more powerful over the decades.
