

SECURITY WATCH

Intricate Citibank phishing scam underway

A new Citibank phishing scam, discovered by MalwareHunterTeam, uses several convincing techniques to get users to give up their online banking details. The scam utilises a convincing domain name, TLS certificates and also requests OTPs. Shortly after the scam was discovered, Citibank issued a press release which consists of a sample email of what leads you to the scam page. As per the press release, the fake Citibank email seems to originate from the American bank, however, the scammers have done a good job at forging the email header to make it appear genuine. The email states that the recipients' accounts have been placed on hold until further verification is provided. The release also noted that this scam doesn't have phishing indicators such as incorrect grammar. It could provide hackers access users' Citibank accounts where they would be able to initiate transactions from the compromised accounts.

MOBILE WATCH

Samsung Galaxy S20 5G series

Surrounded by a barrage of leaks, the Samsung Galaxy S20 5G series will likely have three models including the 6.2-inch Galaxy S20, the 6.7-inch Galaxy S20 Plus and the massive 6.9-inch Galaxy S20 Ultra. While the S20 and S20 Plus will pack a 12MP primary lens, a 12MP ultra-wide sensor and a 64MP telephoto lens, the S20 Ultra will reportedly feature the rumoured 108MP sensor. The S20 and S20 Plus will feature a 10MP selfie shooter, while the Ultra will pack a 40MP one. Cameras aside, the S20 will feature a 4000mAh battery while the Plus variant will have a 4500mAh one. The Ultra, on the other hand, will have a 5000mAh battery for its WQHD+ AMOLED screen with a 120Hz refresh rate. All three models will be powered by the Exynos 990 SoC with a base 128GB of internal storage.

APP WATCH

Adobe Photoshop Camera

Adobe launched their own camera app with a horde of AI-based filters which recognise subjects in photos and suggest filters that can be applied, in real-time. The app lets users preview filters through the viewfinder and even apply them to images that are already snapped. The company has stated that they have used Sensei, Adobe's AI platform to enable the camera app to accurately suggest appropriate

filters. As of now, the app can be sideloaded onto Android phones via the APK which is quite readily available online. The interface of the app is pretty minimalist. The main landing page is the camera viewfinder where you can also access the plethora of filters provided. In the centre is the camera shutter button which is flanked by the filters and gallery buttons. The globe icon on the top left brings you to a repository of additional lenses and filters that are available to download.

The filters provided within the app, as well as the extra ones which are downloadable through the lens library, are extremely fun to interact with. While some provide superficial improvement, others

such as Pop Art, Spectrum and more, completely revamp the look of your photos. The edits are often interesting and visually-appealing. Also, the ability to preview the filters ensures that you are able to adjust the shot in accordance to

the filter you've selected or vice versa. The app is currently in the preview phase and seems laggy and the edge detection in the selfie camera filters isn't the best. Still, it provides you with multiple avenues for your

pictures to shine on social media. Filters such as 'Starry Sky' let you swap daytime sky for a starry one. Overall, it's a fun, alternative camera app backed by powerful AI which can overhaul the sometimes dreary, photo-shooting process.

Transno

Transno is a unique mind-management tool that transforms simple notes into a mindmap. The app can share documents across formats, allows real-time collaboration and cloud storage as well.

Microsoft Math Solver

This app auto-solves any arithmetic, algebra, trigonometry, calculus, etc. problem using AI. Problems can be scribbled on the app itself or scanned from a paper. The app even does out step-by-step explanations.

Tile Shortcuts

Tile Shortcuts lets users add customised tiles (shortcuts) to the notification shade/tray. These shortcuts aren't limited to apps and actions, but also include shortcuts to websites, activities, and more.
