ANNOUNCEMENTS

Sony Vision-S concept car

CES has been increasingly turning into an auto-show over the last couple of years and this year we were pleasantly surprised to see Sony, a major technology company, unveil the Vision-S concept electric car. The Vision-S packs in 33 sensors in and around the car, has multiple displays for each passenger, immersive audio and a multitude of connectivity options. Sony didn't mention too many details but said that the Vision-S is based on a brand new EV platform which was designed by the automotive company, Magna.

The entire dashboard of the Vision-S consists of screens and the UI seemed really polished. Sony is known for their camera sensors which power practically most of the smartphones in existence and their camera sensor leadership help drive the driver assist features. The sensor array consists of cameras, LIDARs, radars and even ultrasonics to provide

multiple data points that are only seen in self-driving cars. While Sony didn't reveal much about the batteries, they did mention that the platform can go from 0 to 60 MPH in about 4.5 seconds and has a top speed of 149 MPH, thanks to two 200 kW motors that are power each individual axle.

The Vision-S was labelled a prototype but the polished nature of the platform could very well mean that you could be seeing a Vision-S on the streets in the next couple of years. Will it come to India? Only time will tell.
