

to avoid glare in a scanned image, enhance resolution and accurately detect edges of the picture. We tried this app quite extensively and it worked perfectly well in most cases.

KEEP YOUR LOCATION PRIVATE IN SHARED PHOTOS

Location data is almost always saved with every picture you click on your smartphone. If you are sharing a picture from Google Photos, the app will also share all the photo details with the recipient which includes the location it was clicked at. You may not always want this sensitive information shared and there is a simple workaround to ensure that it is hidden.

Go to photos.google.com/settings and click on Sharing. Toggle on the option that says 'Remove geo location in items shared by link'. This ensures that any photo shared through Google Photos does not have geo-data attached to it.

QUICK SELECT PHOTOS

The most harrowing task after returning from a long trip is often sharing the wealth of images you have accumulated over the course of the trip on your smartphone. Selecting each photo, one at a time, is mind-numbingly tedious. There has to be a better way! Well, there is.

On Google Photos, you have a nifty quick select option to select multiple images with ease. Hold your finger on a picture and then drag it to the last image you want to send. All the images between these two points will get selected. Batch deletion, moving and sending just got a whole lot easier!

Make the blues pop more in your photos

EDIT DEEP BLUES OR SKIN TONE

Basic editing on Google Photos is clearly visible in plain view, however, some of the more intricate editing processes can be slightly

and click on the Edit icon on the bottom (the second icon from the left). You will see a host of filters you can use here. Toggle to the second tab on the page which gives you options such as Light, Colour and Pop.

Click the down arrow next to Colour and you will find options such as Deep blue and Skin tone. The first 'Deep blue' slider only increases or decreases the intensity of the blues in the image while keeping everything else the same and, similarly, Skin Tone tweaks only the skin colours and nothing else.

If you want your photo to crank up the intensity of greens, just turn up Saturation and decrease Deep Blues and even Skin Tone. You can really play around with these settings to get visually-attractive images that are Insta-ready!

images with a single action. After you've edited the first image, click on the three dots menu on the top right of the screen and select Copy Edits. You can also simply use the copy-paste keyboard shortcuts - Ctrl+C and Ctrl+V, which is extremely convenient.

DON'T SHOW MEMORIES FOR EVERYONE

Hopping onto the 'rediscovering memories' bandwagon on social media, Google Photos has also come out with a feature called 'Rediscover this day'. It allows you to see the pictures you clicked on the same date during the yesteryears and is a form of nostalgia many users enjoy. However, there are possibly some people you don't necessarily want to rediscover, say an ex boyfriend/girlfriend or an

Simply copy/paste edits on Google Photos desktop version

COPY AND PASTE EDITS

This is only possible on the desktop version of Google Photos. It comes in handy if you're editing multiple photos for which you want the same edits. Simply edit one image in the batch to perfection and then you can apply this edit to other

old friend you had a fallout with. To stop seeing memories featuring them, head over to Settings in Google Photos. Go to Memories and then you can remove certain faces you don't want to see in the future. In order to do this, however, you need to turn on the 'Face Grouping' feature.
