

Google I/O 2020 confirmed

Google I/O 2020 will be held between May 12-14 at the Shoreline Amphitheater in Mountain View. <https://digit.in/feb20-47>

Vivo overtakes Samsung in India

Vivo has surpassed Samsung to become the second-biggest smartphone vendor in the country. <https://digit.in/feb20-48>

Teardown: Mac Pro 2019

Extreme modularity translates to easy, stress-free repairs

Dhriti Datta | dhriti@digit.in

Easy-to-extract cover

There's no need for a bunch of tools to slide the casing off the Mac Pro 2019. The smaller third handle on top of it rotates with ease. Simply twisting and pulling this handle uncovers everything that's underneath the casing. Additionally, removing the casing breaks the connection between contacts and pogo pins which terminates the power supply to the machine.

Graphics card module

The graphics card on the Mac Pro 2019 is a custom AMD Radeon Pro 580X. It is fixed to a dock which releases the card when the release latch is pulled. While the module is easy to remove, however, the card itself proves to be a bit harder to detach. Once it has been detached, you will find the 14nm AMD Radeon Pro 580X card, two rows of Micron GDDR5 VRAM (total 8GB) and 2 MegaChips MCDP2920.

12 DIMM (memory) slots and 8 PCIe slots

Without the need for any tools, users can easily access the DIMM slots. With a simple pull of a switch the memory cover pops up where you can see the existing RAM sticks. There are even nifty little diagrams on the insides of the RAM covers that detail where the different amounts of memory must go. A total of 12 memory sticks can be fixed within the Mac Pro 2019. Additionally, there are 8 PCIe slots. All the PCIe cards are held in place by a single switch.
