

Google vs Bing

What happens when you ask Google and Bing which of the two is the better search engine? <https://dgit.in/feb20-51>

Tinder's Panic Button sharing data

Tinder's new Panic Button feature requires you to download a third party app that shares your data. <https://dgit.in/feb20-52>

A

fair share of individuals can safely say that, at some point or the other, they have been

fascinated by robots. Films and TV series only fuel this captivation by showing robots that can take on huge workloads, make life easier for humans and also, take over mundane, menial tasks. Additionally, movies such as Transformers display the anthropomorphisation of robots, not just when it comes to looks but also character and personality traits.

Such 'personification' have inspired generations of young individuals to take up robotics courses where they can tinker around with machines and build their own 'life-like' robots. This early onset of fascination has definitely helped the field grow by leaps and bounds, however, the career itself is extremely dynamic, has a lot more depth and a wide array of use cases, especially in today's technologically-advanced world where AI and ML are thriving.

Robotics, in simple words, is a branch of engineering which deals with design and application of robots and further manipulation and processing of robots utilising computers. It is an interdisciplinary career which is actually a culmination of a few traditional jobs. Broadly these include mechanical engineering, computer programming and electrical engineering. Let's delve into this convoluted but rewarding career path in detail.

RAPIDLY ADVANCING FIELD

Robotics engineers have a bright scope since this career path is expanding enormously due to the barrage of automation needs. Automation is required in several areas such as factories/ manufacturing plants, farms, mining, and more, which are still very labour-intensive. Human labour, that is. By reducing the number of humans that have these menial jobs, that could be easily automated, the number of accidents can reduce, overhead costs will be slashed down significantly and the labour can be employed in more mindful work.

ROBOTICS ENGINEER

A dynamic field with several arms

Dhriti Datta | dhriti@digit.in

As per the book 'What to Do When Machines Do Everything' written by Malcom Frank, Paul Roehrig and Bring Pring, automation and robots will take away 19 million jobs but they will also create 19 million new jobs. So, robotics engineers hold a prime position in the job department since they're the ones creating the automation that will cast some jobs away. Except when machines or robots can make themselves, but that's a ways away...

Devavrat Joshi, a Robotics Engineer from Pune believes that Robotics, as a

career in India, leans towards process automation rather than the creation of actual humanoid robots, some of which purely exist of our entertainment. He opines, "We hear everyday about how many people are unemployed in our country, but, not all of these are willing to work 'menial jobs'. This may be understandable, but those jobs still need

Process automation is a huge goal for robotics engineers
