HAL3.enabled=1

Tap the save icon and then restart your device. Or you could simply download a Magisk module called 'Camera2API enabler'. Install the module using Magisk Manager and Camera2 API will be enabled. After this, you need to install the Google Camera mod onto your device. Finding and picking the right mod for your phone can be tricky, but you can look for genuine GCam mods for your specific phone on sites such as XDA developers. This article does a great job listing out GCam Mods for various popular devices - <https://dgit.in/GCamMods>.

ALLOWING A GUEST TO CONNECT TO YOUR HOME WI-FI USING NFC TAGS

One of the varied uses of NFC tags or stickers includes allowing guests to connect to your home Wi-Fi automatically just with a simple tap. Gone are

NFC stickers/tags can be found easily on Amazon or AliExpress

the hassles of dictating or typing out the super-complex Wi-Fi password you have set, on the phones of the countless guests you may have. For this to work, however, your guests will need to have an NFC-enabled phone, which is, fortunately, not too difficult these days since most manufacturers have added this nifty functionality to their devices. Firstly, you will need to buy a couple of NFC tags/stickers.

MORSELIGHT - FLASHLIGHT + MORSE CODE

An app on the Play Store called MorseLight utilises your smartphone's flashlight to convert text to morse code which can then be decoded by anyone within line of sight. You can also decode incoming signals. You need to manually input the signals you're seeing and the app will convert it back to English.

There are plenty available on Amazon India that you can purchase easily. A standard pack of eight usually costs under ₹500. Next, install an app on your phone which allows you to customise these tags such as Trigger or NFC Tools. After this, the process is quite simple and intuitive. Ensure your NFC tag is erased if you've used it before, and then write the Wi-Fi data to your tag. To do this, go to Wi-Fi and then long press on a network you want your guests to connect to. (Make sure that your phone is NOT connected to the Wi-Fi network when doing this). After long-pressing, select 'Write to NFC tag' and then input your network's password and then hit 'Write'. Tap the NFC tag to the back of your phone where the NFC sensor is located and that's it.

The next time someone comes over, ask them to simply tap the back of the phone to the NFC tag and bam! Their device will ask them if they want to connect to the network, get them to click 'Connect' and they can hog... ahem, use your home Wi-Fi to their heart's content.

Pro tip: Don't want to buy NFC tags?

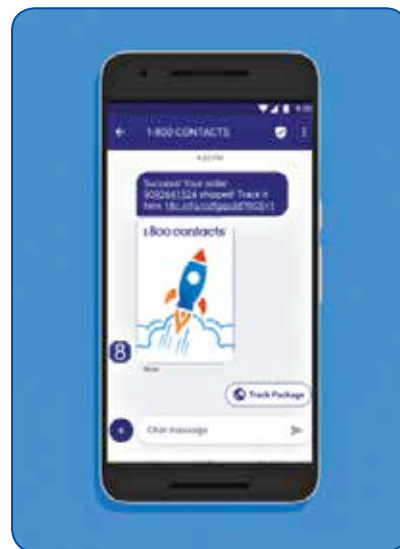

You can also let your guests access your home Wi-Fi using QR codes. Go to Settings, and Wi-Fi and then tap on the current network. The QR code will be pulled up when you hit the Share button. You can print this code and your friends can scan it from their phone's camera to connect immediately.

ENABLE RCS IN GOOGLE MESSAGES

The rival to Apple's iMessage, RCS messaging is the next step in the world

of SMSes. It allows users to send high-quality images, share their location, engage in group chats and even video calls. All free of charge, of course! If you want to utilise this service immediately on your Android phone, you can, in just a few steps. Google has officially released RCS support in its Messages app now and activating it is extremely simple.

All you need to do is follow these steps. Firstly, if you haven't already, download the Google Messages app from the Play Store. Once installed, open the app and head over to the Settings menu. Tap Chat and then toggle on 'Enable chat features'. You have officially skipped the wait time for when Google actually officially rolls out RCS features for your device. Don't worry, even though you have used this

Get RCS features on your Android device right away!

"unofficial" method to gain access to the RCS features, a Google representative tweeted that people who have used unofficial methods will automatically get official RCS support when it releases for your device.

SKIP SONGS USING VOLUME BUTTONS

This feature elusive was once only accessible to those who have rooted their device, but now you can long-press volume button to skip tracks/ go back to the previous track without rooting your device. An XDA member named Cilenco developed the Skip Track by
