EDITING PHOTOGRAPHS ON TODAY'S POWERHOUSE SMARTPHONES

is as straightforward as clicking on a filter of your choice. While filters are still powerful tools that can transform an image significantly, they usually do not improve the core characteristics of said image. This is where advanced tools come in which allow users to modify the image on a more granular level. There's an abundance of applications that let you tap into advanced tools for photo-editing on the App Store and Play Store. Amongst these apps, Snap-

seed is one of the leading free photo editing apps for both Android and iOS devices. Turning a raw photograph into an aesthetic masterpiece, however, will require some practice and tapping into some of the hidden tools and features. Let's delve into a few tips and tricks that can assist you to make images social media-ready.

Note: Snapseed is available for Android 4.4 and above and iOS 9.0 and above. Also, note that this Level Up will not consist of basic functions such as brightness, contrast, white balance and more.

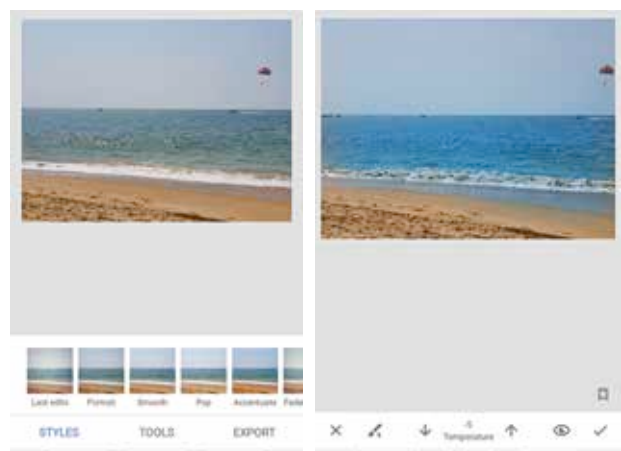

SELECTIVELY EDIT AN IMAGE

Basic tools in Snapseed allow you to manipulate merely the main parameters of a photograph. Sometimes, you may just want to apply an edit to a

certain portion of the picture and not the entire frame, which is something most commonly-used filters and tools cannot do. Selectively editing a certain portion of an image can make it pop out, or even become understated to maximise the effect of the rest of the picture. There are two advanced tools in Snapseed that allow you to pick what area should receive the edit. The first is the Selective Tool. Go to Tools > Selective,

you'll find a small circle is now placed on the image. Simply drag this target to the desired portion on the image. Now, you can selectively change parameters such as brightness, saturation and more by simply sliding on the screen.

The second tool is the Brush Tool which is also located in the Tools menu. Snapseed gives you the option to apply an array of edits such as exposure, temperature and saturation, using the Brush Tool. Once you select the particular brush you want to utilise, simply drag your finger across the area you want to manipulate. A great example of this is making the ocean pop more by using -10 Temperature Brush Tool. If the colours of the ocean look lacklustre, simply swipe across it using this Brush and the blue will instantly transform into a more dynamic version of blue. Inversely, if you want to make a sandy terrain look more dynamic, simply increase the temperature and swipe across.

Make certain colours pop (here: ocean and sky) while keeping the rest of the picture (here: sand) the same.
