### Android 10 finally arrives

OnePlus 5T, Samsung S9 and more finally confirmed to get the Android 10 update. <https://dgit.in/mar20-35>

# ANDROID 11 DEVELOPER PREVIEW

Here's how you can  
install and preview Android 11  
for developers on your  
Pixel smartphone

**T**

he arrival of every new year ushers with it a brand new Android version. For tinkering-lovers who

cannot wait to get their grubs on the final annual version of Android, Google always releases Developer previews and betas. It brings together the entire enthusiast Android community while they collectively put their heads together to test the new Android version and figure out any kinks and shortcomings. Google has officially released the Android 11 Developer Preview which comprises of early baseline builds for developers. The company very clearly states that this early preview is not suitable for daily use by “consumers and early adopters”, which is why they have made this available only via manual download and flash. This doesn't necessarily mean that early adopters can't get their hands on this preview.

While Google completely shelved its quintessential dessert branding with the arrival of Android 10 (yes, we're still miffed about this), the

company continues to internally refer to new Android updates with the next alphabet in the sequence – Android R for Android 11, in this case. So, we finally have the developer preview for Android R/11 for supported (Pixel) devices. Developers (and enthusiasts) can load up the new Android software on their devices and test it out. Developers, especially, can now develop Android 11 APIs and test their app with all the behavioural changes the new version brings. The good folks over at XDA developers have outlined two options to load the Android 11 developer preview on Pixel devices. Here's how you can go about doing it.

*Note: This tutorial will only work on supported Pixel devices, which include the Pixel 2, Pixel 2 XL, Pixel 3, Pixel 3 XL, Pixel 3a, Pixel 3a XL, Pixel 4 and Pixel 4 XL. Note that if you're not a developer or not confident in your tinkering abilities, we advise you to stray away from loading this preview since it will likely contain a host of bugs and issues since this is NOT a daily driver. Also, remember to back up your data*

*before going through with this tutorial since flashing back to Android 10 will wipe your entire device.*

## METHOD 1 – VIA RECOVERY AND ADB

In this process, you will have to side-load the OTA package from Recovery using ADB. For the majority of people out there with unlocked bootloaders, this is the process for you. You will also require a PC with ADB tools installed on it. Now, let's get started.

**STEP 1** Firstly, download the .zip file of the update onto your PC from this link – <https://dgit.in/Android11zip>. Download the corresponding link under the OTA column for your particular Google Pixel device. You
