

Moto Razr durability test

Find out how durable the Moto Razr is in JerryRigEverything's durability test. <https://dgit.in/mar20-29>

New Razr vs Old Razr

How does the new Moto Razr compare the original Moto Razr V3? Find out in this showdown. <https://dgit.in/mar20-30>

Teardown: Motorola Razr

The reboot of the iconic Razr of the yesteryears

Dhriti Datta | dhriti@digit.in

Accessing the rear cover

Remember the simpler times when all you had to do was slide off the rear panels (plastic or metal) to access the battery of the phone? The modern-day rendition of the Moto Razr needs strategically-applied heat and quite a bit of prying to do the same. However, while separating the back-panel, the fingerprint sensor cable is found in a rather precarious position which can easily be torn if hasty.

Concerning gap between the display and hinge

Motorola designed the all-new Moto Razr foldable phone around the OG design of the 2004 Moto Razr flip-phone, and not the other way around. Therefore, you can see certain concerning build issues. One such issue is that midway through the folding action, you'll be able to see a rather alarming gap between the hinge of the phone and the display. Certain reports have already indicated that the screen is peeling off right at the fold...

Baby batteries and a single rear camera

The new Moto Razr comes equipped with two batteries which amount to a total of 2510 mAh. Rather lacklustre for a 2020 smartphone, we must say. In comparison, the Galaxy Fold has two batteries as well, with just one having about the same capacity as both of Razr's batteries. On the new Moto Razr, the first battery is easily extractable (with slight coercion) after prying off the rear panel, but the second one (behind the Quick View display) is hidden behind some cables. Surprisingly, this exorbitant phone sports only a single 16MP rear lens.
