

Ploonets

Scientists gave this cute name to exomoons that are ripped away from the gravitational pull of their planets. <https://dgit.in/mar20-07>

Mucus woes in space

When in space, the lack of gravity causes mucus to accumulate in the sinuses instead of naturally draining. <https://dgit.in/mar20-08>

sci

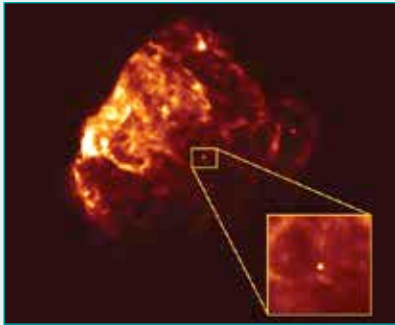

1000 WORDS

↑ Shown here is the Pleiades star cluster that is visible to the naked eye and more commonly known as the seven sisters. The flares are from the telescope itself.

↑ This supernova remnant has acted like a cannon, and ejected a pulsar, that is moving at 1,000 kilometers per second. The trail of the pulsar can be seen in the center left.

← Imaged here in the supernova remnants Puppis A is a young neutron star, an object with a diameter of about 60 kilometers, but as massive as 30 Suns.

← This dark spot is called "The Abyss", but scientists really do not understand how such a spot could be created on Jupiter, and even if it is a hole or a cloud.

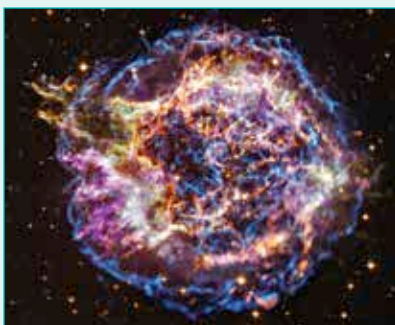

← This is a rare detailed photograph of a little understood atmospheric phenomena known as the red sprite. It is a form of lightning, but a very cold one.

Stephane Vetter

← The New Horizons probe imaged Pluto in extreme detail, showing that the distant world was seismically active, and more similar to a planet than anyone had thought.

← This false colour image allows scientists to figure out how material is reused in the galaxy. The silicon is red, sulfur is yellow, calcium is green and the iron is purple.

← The Arp 188 galaxy has a tail like a tadpole, perhaps created after an interaction with an intruder galaxy. The tail stretches for 280,000 light years.
