

Dyson Lightcycle Morph

The Lightcycle Morph is a lamp, albeit, a rather pricey lamp, at £500 for the desk version. Why is it so pricey, you ask? Because they're designed to last for upwards of 60 years.

Like with most Dyson products, there's a lot of attention to aesthetics as well, so it's definitely a nice looking lamp. As for the insides, the Lightcycle Morph features the same heat pipe technology that was present in the original Lightcycle. The Morph improves on this by running cooler and consuming far less energy, even lesser than LEDs.

Thanks to its double-hinged arm and 360-degree rotating LED head, the Morph has the ability to be 'morph' into different configurations. In addition to acting like a regular reading light, the Morph's head can be turned around to whatever angle you please. Additionally, the head can be folded in on the lamp, forcing the light through the Morph's stand, which features a polka dot hole design. This diffuses the light and provides dimmer lighting, more akin to candlelight. The Morph also has a 32-bit micro-controller unit that reads and analyses daylight data, and can basically turn the lights on and off, and even make the lights warmer or cooler, according to the time of day.

There is of course, an accompanying app which gives you more control over how the lamp behaves at different times of the day. Of course, you can manually adjust brightness, warmth, alarm settings and more on the app as well. The lamp has a motion detector on it as well, so it can detect if you're getting up at night to go to the toilet and automatically light up.

Samsung Sero

The Samsung Sero is an interesting TV. In addition to being a proper QLED 4K TV, its defining factor is the fact that it rotates. Yes, it's a TV that can rotate, and it does so automatically based on the orientation of the content your watching, or if you're viewing content via your phone, according to your phone's orientation.

The TV was first showcased at CES 2020, and has been labeled as a TV for gen Z, or the Tik Tok generation. Of course, it doesn't come close to Samsung's other TV, the Q950TS that was showcased at CES, but if you're looking for a 4K TV to play mobile games on, well, you're actually in luck.

Imagine being able to play your favourite mobile game at 4K on a 47-inch screen. The TV itself looks like a painting mounted on an easel stand. There's ample amounts of space under the TV while it's in its horizontal orientation. Most of this space is taken up when the TV switches to vertical mode. All of the connections are on the backside, and neatly out of the way, which is much appreciated.

According to Samsung, the TV is compatible with any smartphone, including Apple phones. However, while the TV will rotate automatically for Android phones, iOS users will not have the same luxury and will have to rotate the TV manually. The Samsung Sero is also not cheap, and will set you back by roughly \$1,600. Global prices have yet to be confirmed.

Royal Mail video game stamps

We hardly send personal emails anymore, let alone letters. So, the need to buy postage stamps is understandably small. However, that hasn't stopped the British Royal Mail from introducing a new range of postal stamps which pay homage to classic British video games.

Royal Stamps announced a set of 12 stamps, with each referencing classic games from the past few decades. Of these, four are dedicated to Tomb Raider, featuring the original Tomb Raider from 1996, Adventures of Lara Croft from 1998, Tomb Raider Chronicles from 2000 and the 2013 Tomb Raider reboot.

The other stamps feature games such as the space flight sim pioneer, Elite; the real-time strategy game, Populous; 1991's puzzle game, Lemmings; and even 1995's classic, Worms. There's also Dizzy, Micro Machines, Sensible Soccer, and Wipeout, which rounds out the 12 stamps.

According to the Royal Mail, "the UK has been at the forefront of the video games industry for decades", and the stamps are meant to celebrate the industry and their landmark creations.
