

Rotofarm

Funding: US\$ 147,537 pledged of US\$ 9,464 goal

Link: <https://dgit.in/Rotofarm>

Rotofarm is an artsy-looking, countertop hydroponic garden encased in a circular frame which rotates in order to allow plants to grow more quickly. Inspired by NASA's zero-gravity technology, the plants rotate a full 360-degrees every hour and the period of 'negative-gravity' negates the growth-suppressing effects of gravity, thereby allowing plants to grow at a more rapid rate. A low voltage motor and internal power supply within the Rotofarm keep this contraption rotating all-day-round. The time spent right-side-up and upside-down, according to the company, counteract each other, therefore achieving a kind of 'zero-gravity' where plant growth is unrestricted. All you need to do, as a user, is fill the tray or base of the device with some nutrient-filled water every few days and then this water is funnelled to the top. When the plants are at the bottom half of their rotation, they will absorb the water and nutrients. Excess water picked up by the plants simply drips down when they are upside-down to land on the leaves of other plants, thereby accelerating their growth too! The Rotofarm requires absolutely no soil and even has automatic lighting which mimics the sun. You can also control the device via the accompanying app on your phone. The pack also comes with pre-planted seed pods and nutrients. Additionally, since the watering and light system is automated, it ensures that there is zero water wastage too. With Rotofarm, you can fit around 5.2 feet of growing space in a compact cylinder which takes up three times less space. So, you have your very own hydroponic garden which takes up less space, less water, and minimal maintenance.

MAD Gaze

Funding: US\$ 159,858 pledged of US\$ 10,034 goal

Link: <https://dgit.in/MADGaze>

The MAD Gaze smartwatch uses gestures to control different actions. The watch was originally unveiled at CES 2020, the watch features over 33 simple gestures to control tasks such as sending text messages, controlling music, and much more. The gestures include hand, wrist, and finger movements which can be used to trigger certain apps. All the gestures can, of course, be customised as per the individual's tastes and the gestures can also be used for playing AR and VR games using the company's advanced motion sensing technology. The Kickstarter page of the product demon-

strates a few examples such as snapping your fingers for picking up calls and tapping two fingers together to pause/play music or media on a smart TV. All of this is possible due to the 9-axis gyro and acceleration sensor

embedded within the watch. It allows the device to accurately capture different vibration waves as well as movements of the hands. An intelligent algorithm is then put to work to analyse these gestures and correspondingly trigger custom actions/functions. In addition to its gesture control capabilities, the MAD Gaze smartwatch also comes fully stacked with features commonly-found on smartwatches such as fitness trackers, GPS, IP67 water resistance, heart rate monitor and more. There's also quite some room for customisation since the watch's straps are interchangeable and there's a total of 16 vibrant colours to choose from.

EyeRide HUD

Funding: US\$ 499,467 pledged of US\$ 12,806 goal

Link: <https://dgit.in/EyeRideHUD>

Heads up displays in helmets are slowly but surely gaining traction among motorcyclists across the world. While some companies are manufacturing helmets with in-built HUDs, others are going down the opposite route and catering to those individuals who would rather buy a HUD system which can be retrofitted into their existing helmet. One example of the latter is EyeRide HUD from the French company, Eyelights. How-

ever, EyeRide doesn't just include an HUD. It also comes equipped with GPS, voice commands support and more. All of these technologies combined together can allow motorcyclists to solely focus on their ride instead of bending downwards and looking at their phone strapped onto their bike. The company claims the EyeRide saves bikers

4.2 seconds of reaction time when using HUD technology instead of a smartphone. The EyeRide can display important information such as Maps, calls and more. It projects a bright, transparent screen onto your helmet's visor. The display is a small Nano HD Sony OLED display which boasts of 3000 nits brightness to ensure that the display is visible even on bright, sunny days. The EyeRide even features 55mm flat speakers and a directional microphone which allows bikers to take calls and stay connected without the added risk of looking down at their smartphone to accept a call. Additionally, users can also listen to their favourite tunes from Spotify and YouTube.
