

of the chat window to suit your preference.

It also adds an audio compressor right next to the volume slider that reduces the volume of loud sounds and amplifies quiet sounds, thereby normalising or compressing the volume based on your audio preference.

 CHATTERINO

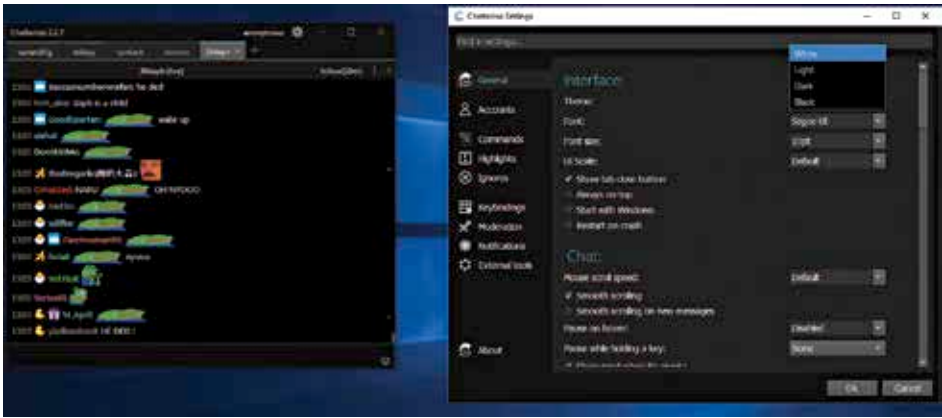

Chatterino is the go-to application which makes interaction with multiple streamers easy. It is an open-source chat client optimised for Twitch. The primary feature of this software is that you can

switch between multiple chat rooms via tabs. The same way you switch between multiple open tabs in a browser. An open stream is not a necessity to use this. The client comes with BTTV and FFZ emotes by default.

The settings tab offers a bunch of features including the option to change the interface based on your preference enabling you to switch between different themes including light or white for morning birds and dark or black modes for any night owls. Chatterino allows customisation of fonts and font size as well.

Addition and deletion of multiple accounts is another great feature for cases in which you are banned on one channel but still want to chat and interact with the streamer with quick account switching options.

Ability to view deleted messages and censoring messages (**) based on your parameters is also made possible.

Other than that it includes keybindings and also allows you to set push notifications for your favourite streamers for when they go live.

 TWITCH NOW

Twitch Now is a Chrome extension that helps you keep track of the channels that you follow. This extension adds an icon on

the top-right corner of the browser which upon clicking displays a drop-down list, listing all the live channels that you follow.

Upon logging in, it automatically imports all the streamers that you follow, thereby saving you the hassle of searching and adding them one by one.

Other than that, you can also browse different sections or categories on Twitch without actually switching tabs or opening a new page. It also shows you the top streams with high view counts in case you want to check them out.

The settings tab allows you to filter streams based on your language preferences, change the theme and even upload your own custom push-notification sound alert.

 UNWANTED TWITCH

This browser extension allows you to block certain channels, streams, categories, titles or tags based on your preference.

The blacklist settings are automatically synced between devices which can be turned off via settings. The import and export options allow you to share the settings saved on your computer.
