ONCE A MERE PERK THAT CAME ALONG WITH AN AMAZON PRIME SUBSCRIPTION, Prime Video has quickly become a true competitor in the streaming services race since then due to its diverse collection of content. For Indian users, Prime video is brimming with Hindi as well as regional content ensuring that there is something of worth for just about any demographic. Add to that, an easy-to-use and familiar interface and you have a streaming service well worthy of your hard-earned dough. Through Amazon's

acquisition of IMDB, users can also access a pretty nifty feature called 'X-Ray' which pulls up information and interesting factoids about the content you're watching. This is one of the well-known features Amazon Prime Video has to offer, however, there are some lesser-known tricks and features you can use which will boost your streaming experience on Prime Video.

SHARE YOUR PRIME ACCOUNT

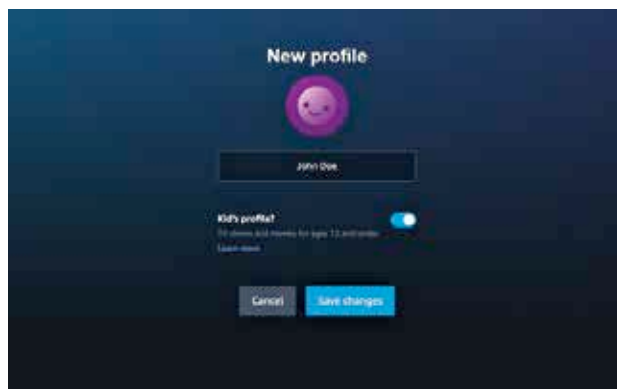

At ₹999 per year or ₹129 per month, Amazon Prime Video already does undercut its biggest competitor Netflix by a lot when it comes to value. However, to get the most bang for your buck, Amazon Prime Video also allows subscribers to share their Prime benefits with their family for no additional cost whatsoever. Profiles have finally

been introduced for Amazon Prime India which essentially means that you and your family/friends (who have access to your account) can have separate recommendations, watch histories, season progress and watch lists! It means that your Prime Video algorithm won't be corrupted by say, your cousin or niece's cartoon shows or the preferences of your parents or grandparents. Additionally, Prime video has one-upped Netflix by allowing subscribers to create six profiles as compared to five on Netflix. To do this, simply go to 'My Stuff' on the mobile app, click on your username and add profiles. On a browser, simply head over to your username and from the drop-down list select 'Add new' to add a profile.

STREAM VIA GOOGLE CHROMECAST

Amazon Prime Video is one of the only streaming services that does not support streaming through Google Chromecast natively. This is probably due to the less-than-cordial relationship between the two tech giants, which has led to one of them withdrawing its services from the others platforms. Fortunately, there is a rather simple workaround to the Chromecast-Prime Video debacle. Google Chromecast allows users to mirror their screen, so you can simply cast your device's screen to stream Prime Video. On Android smartphones, you can cast your screen from the quick settings of Google Chromecast. On PC, you will have to open Prime Video on Chrome and then select Cast from the three-dot menu on the top right corner of the screen.
