

recommended for printing purposes, so they can be left as is. Click on OK.

STEP 3: MAKE THE MASTHEAD

Now, it is the time to allocate the boxes. You will see two pages, with a blue outline showing the markings, and a red outline for the text box. The name of the newsletter is similar to the masthead in the newspapers, and you probably want to go with big bold text that occupies the entire top edge. First, drag the top edge

of the existing box with three columns, so that it does not interfere with the masthead. Then, go to Insert > Insert Text Frame. Click and drag the box with the red outline right across the top of the first page. Click on it again to enter the text. Now, hit F2 or go to Windows > Properties. This is where you can change the font, alignment and other properties of the text. Click on the Text column, to uncover the text options. Now, center align the text, and keep increasing the font size till it occupies the entire top edge. You can add the date and periodicity information in smaller text boxes below the masthead, or some other information such as the name of the author. Now, select the masthead, and the text boxes, and go to Item > Is Locked, or press CTRL + L while they are selected. This prevents the boxes from being accidentally moved around.

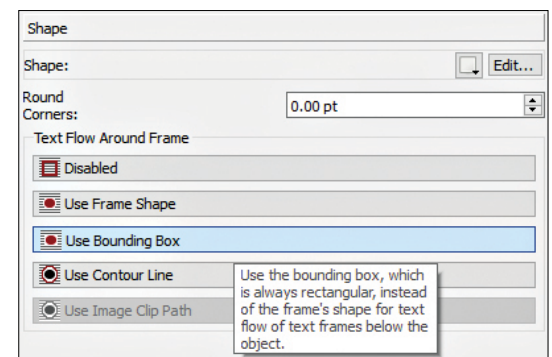

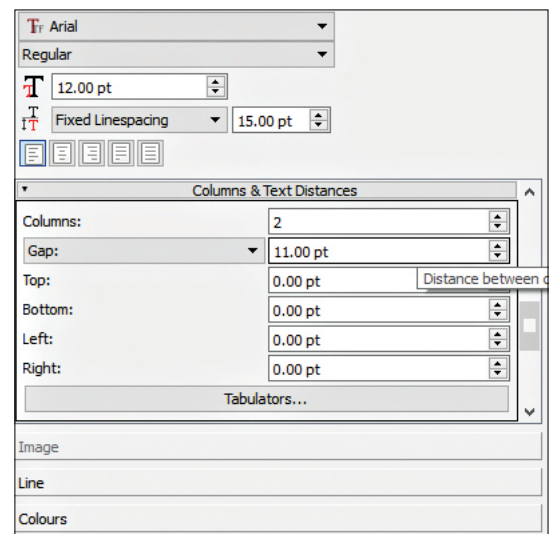

STEP 4: ARRANGE THE ELEMENTS

For the first page of the newsletter, we want a column on the side with a few snippets, a lead story with a headline,

and another story on the bottom. We go about doing this by creating a number of text boxes. There is one text box for the column on the right, a textbox for the lead story, and the original three columned text box is shortened to occupy the bottom of the page. There are also two text boxes for headlines. To make laying all of this out easy, there are two options that can be used in the View menu. These are View > Show Grid, and View > Show Baseline Grid. The grid option is just a graph that can be toggled on and off. The baseline grid shows evenly placed horizontal lines, which helps with spacing between elements. Now, we need to add two columns to a box, instead of three, as the text box is two columns in width. This can be done by selecting the text box, going to Properties > Text > Columns & Text Distances and changing the column number from 1 to 2. It is also important to change the Gap to 11 pt, as noted in Step 1.

STEP 5: START FILLING IN THE BOXES

Now, you can go about adding the text and content to all the text boxes. If you want an image in one of the stories, you need a different kind of frame. Go to Insert > Insert Image Frame and drag the frame right across the text box. To add an image, double click on the image frame, and select the image from the list. Scribus also allows you to add some image effects like blur and monochrome through the software itself. Right click on the frame, and choose Adjust Image to Frame. Now, if you resize the frame, the image will always occupy the maximum width or the maximum height, without changing the aspect ratio. You can also choose Adjust Frame to Image, to simply make the frame the same size of the image. Now, the text is appearing behind the image, so go to Properties > Shape > Use Bounding Box to wrap the

text around the image. That is it, your newsletter is ready!

STEP 6: EXPORT FOR PRINTING

Go to File > Export, and select one of the options for exporting the file. It is best to consult with your printer before taking this step, but typically PDF or PNG should work just fine. The final design is shown below.
