

Portable devices you need

If you think the smartphone has replaced all the gadgets that you need, take a look at this list. <https://digit.in/apr20-19>

No tech for babies

A strong case for avoiding smart electronics for taking care of infants. <https://digit.in/apr20-20>

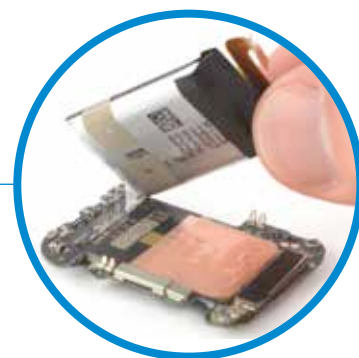

A bunch of chips

The motherboard houses an array of chips and modules such as the Qualcomm Snapdragon Wear 3100 with its 32-bit ARM Cortex A7 CPU and Adreno 304 GPU, the Qualcomm QCC1110 co-processor, the Qualcomm power management sub-system, a Qualcomm wireless connectivity chip and a couple of ICs for various purposes. The backside of the MoBo is less crowded with only two chips.

Xiaomi Mi Watch

Sizable battery

The battery and motherboard are attached to each other inside the watch with some glue. Upon separating the MoBo from the battery, you can see that the power cell is pretty large, especially in comparison to the one found inside the more expensive Apple Watch. In terms of sheer numbers, the Mi Watch packs a 2.167 Wh battery which leaves the tiny 1.129 Wh battery on the Apple Watch Series 5 in the dust. According to the company, the watch can pull off a whopping 36 hours on a single charge while some users and reviews report higher battery capacity when it comes to everyday use.

Picking at the remains

All that remains is a few sensors and parts at the bottom of the watch barrel. A pair of tweezers are enough to safely extract the final circuit board and parts since most of them are modular, which makes repairs easier. The last circuit board houses the heart rate sensor, a couple of LEDs, four data and charging contacts, two microphones and lastly, an optical encoder which reads the crown's rotation.
