Dyson Corrale

Dyson isn't normally a company you'd expect a hair straightener from, but here we are. The company that normally deals with blowing and sucking things has now come up with a rather pricey hair-straightener. The Dyson Corrale hair straightener is the third hair care product from the company, following their supersonic hair dryer and the Dyson Airwrap styler. Both of these products dealt with blowing or sucking air in some way or the other, and also cost a bomb each.

Only the latter applies to the Dyson Corrale.

The Dyson Corrale features a flexible copper plate design, which is meant to prevent stray hair from escaping, and also doubles as an efficient heat conductor. This basically means that you'll need to use the product for far less time than conventional straighteners. But that's not all. The biggest draw possibly, is that the Dyson Corrale is wireless.

As with all Dyson engineered products, it's also

got a very premium look to it. Of course, the looks and functionality come at a hefty price of \$500. Is it worth it? Well, their previous hair care products are consistently sold-out, despite their price-tags, so if that's an indication of anything, we're going with it probably is worth it. You ideally want to wait for reviews.

Contactless Lift Buttons

A Chinese start-up has come up with contactless lift buttons which will allow passengers to use buttons that are projected into the air. This of course, was created in an effort to prevent the spread of the novel coronavirus.

The design makes use of the company's patented technology, which they call the DCT-plate, which is basically a glass mirror that reconstructs lights to form images in the air, almost like a hologram of sorts.

However, the hologram itself is not sensitive to touch, that job is left to an electric sensor that's inserted into the reflector. This sensor can detect hand movements in the air, thereby allowing you to input commands without needing to directly press the lift's control board.

These contactless lift buttons are already seeing action in various locations across China, including a hospital in the Anhui Province of eastern China. The start-up's CEO, Han Dongcheng has told the press that you can soon expect the technology in many more public buildings and regions across the country.

The lift is actually considered a particularly high-risk place for the spread of the virus, since people inside have to breathe the same air and press the same buttons. This technology helps greatly with reducing possible contact between people. People in China have otherwise been advised to use toothpicks or tissues to use the control board.

Qwake C-Thru

The work of a firefighter isn't easy. We don't really need to point that out, they are after all, fighting literal flames. When it comes to fire, there's so much that they have to deal with, with smoke everywhere being one of the things, making it difficult to both breathe and see. In these situations, it can be difficult for anyone to think straight, even trained professionals. That's where the Qwake C-Thru heads-up display comes in. The smart device makes use of AR to help firemen see through the smoke (hence C-Thru). The video stream makes use of an on-board

thermal camera to provide vision even in thick smoke. It's also got AI onboard to help with image recognition, providing firefighters with outlines of objects and people in green.

Firefighters usually carry thermal cameras of their own, but these are usually handheld devices, with small displays. Additionally, they would need to look away from the camera to actually get any work done. With the C-Thru display's HUD, that problem goes away.

The C-Thru is still in works, and Qwake tech CEO Sam Cossman says they're trying to put everything they can into the C-Thru to make it the device of choice for first responders around the world. The product is expected to be available by 2021.
