

DROOLMAAL

Montblanc Smart Headphones

When you think of Montblanc you normally think of luxury watches, leather accessories, or other premium and classy stuff. You don't normally think of headphones. Noise-cancelling ones, at that. But, that's exactly what we have here, Montblanc's first ever foray into the audio category, with a pair of extravagant noise-cancelling headphones.

Naturally, these headphones won't come cheap and are designed for those who want luxurious head-

phones during their travel. Speaking of travel, these headphones come with a foldable design and come with a case as well. It's wrapped in sheep leather all over the frame. The ear cups are made out of silicon.

The Montblanc Smart Headphones come with both passive and active noise cancelling. They can be switched between using a toggle button on the side of one of the cups. There's also a dedicated Google Assistant button on the cans. No word on Siri support yet.

On a single charge, these wireless headphones will give you approximately 20 hours of playtime, which is pretty impressive. The Montblanc Smart Headphones are available in three different colours as of right now, black leather with a chrome metal finish, brown leather with a gold-ish metal finish, and a light grey leather with a gold-ish metal finish. If you're looking to get your hands on the Montblanc Smart headphones, they'll set you back by about \$600.

Analogue NT-Mini Noir

When it comes to recreating retro consoles in the most premium way possible, one of the better known players in the game is Analogue. This time around, they're bringing back a retro system, the NT-Mini, which they first released in 2017. The FPGA-based NT-Mini is capable of running classic games from the Nintendo Entertainment System (NES)/Famicom at 1080p using an HDMI cable. Basically bringing retro standards up-to-date in a way. V2 of the NT-Mini even features a different look from the original NT-Mini, which was available in a silver and black finish. The new NT-Mini, or Noir, features a premium anodized gunmetal finish with gold-plated ports.

The Noir also features some improvements in the form of a better NES cartridge slot, an improved user-interface, a new controller from 8BitDo included in the box, and speaking of the box itself, better packaging. Other than that, the rest is pretty much the same as the original Nt-Mini.

Like we mentioned earlier, the system utilises FPGA to simulate the video games, what you're playing is not via an emulation software, it's the original game as it was played back in its heyday. The NT-Mini Noir is available for pre-order, and if you're keen on getting your hands on one, it'll cost you \$500.
