

DIY THIS QUARANTINE

Instead of twiddling your thumbs, get your hands dirty with these DIYs

Adhyayan Panwar | feedback@digit.in

You are probably stuck in your house for weeks now and life seems duller than ever. Finished everything on Netflix and Prime? (oh, and they are throttling their streaming quality from HD to SD) No weekend football to watch? Can't hang out with friends? Well, these certainly are reasons that might make existence seem futile but we are here for the rescue. These tech and science related DIYs will keep you busy and buzzing. So let's get started!

01 EXTRACT DNA AT HOME:

Whenever people hear DNA the first image that pops up in their mind is

that famed double-helix ladder like structure. DNA (Deoxyribonucleic acid) is the stuff we are made of. It holds all our genetic information, but it's nearly impossible to see its structure even with the most powerful microscopes. There is, however, a method to extract DNA at home, DNA you can see! You'll need these things:

- Small paper cups (the smaller the cup, the better)
- 1 bottle of colourless sports drink (or a strong salt water solution)
- Liquid dish soap (colourless is preferred)
- Few drops of pineapple juice
- 1 wood skewer (something like a long toothpick)
- Alcohol (rubbing alcohol will do, it

is better to grab a higher percent alcohol if possible)

- Narrow container with lid
- After you have gathered the ingredients, which should probably be lying around in your house, let's get started with the experiment:

1. Before starting, put the alcohol in the freezer 24 hours prior.
2. Take a mouthful of the sports drink (or the salt solution) and without swallowing it, swish it around your mouth for 30 seconds, scraping your teeth and inside of the cheeks (ensure your mouth is clean).
3. Now spit the mouth contents back into the cup. Then pour it into the narrow container until it's filled half a inch from the bottom.
