

Make sure you don't get any glue on the glass surface as it may reduce projection quality!

This will be your projection box.

Now, let's move on to make the phone holder for the projector:

1. Measure the height and the width of your box.
2. Now, cut out a rectangle with dimensions of the height and width of the box. This will act as the back support for the phone.
3. Cut out another rectangle but this time half the height and keep the width same. This will be the bottom support.
4. Attach the bottom support to the back support so that they form a 90-degree angle.
5. Now, tape your phone in landscape mode to the phone holder. Try to tape the edges of the phone.
6. Make sure the image is upside down or else the resultant projection will be upside down.

A home-made smartphone projector

7. Put the phone holder in the box length-wise.
 8. Additionally, you can cover the inner backside with foil to increase clarity.
- Now, take your projector in a dark room and enjoy your favourite shows! If the picture turns out to be blurry, try sliding the phone back and forth to adjust and find the focus point to get the best quality.

04 DIY JELLYFISH

Most of us know what jellyfish are. They are these squishy gelatinous fish with tentacles that seem to float peacefully in oceans, which we only know from the film 'Finding Nemo'. Jokes aside, jellyfish are infamous for their excruciatingly painful stings and famous for not having a brain, and have remained an interesting subject

to study. While it is certainly impossible to create a living jellyfish at home or anywhere else for that matter, you can create something that looks eerily like a floating jellyfish! Grab the following stuff:

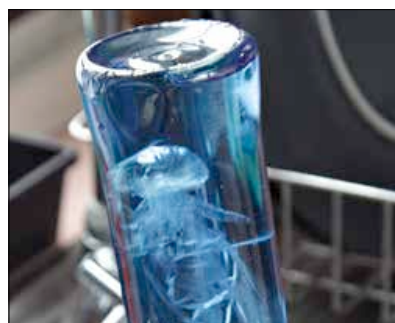

Manipulate the plastic bag to resemble a jellyfish

- Transparent plastic bag
- Plastic water bottle
- Thread
- Food Colouring
- Scissors

Hopefully, all this will be available in your kitchen and you can move on to the next phase in making jellyfish look-alikes:

1. Flatten the plastic bag and cut off the handles and the bottom part.
2. Now cut along the sides to divide the whole plastic bag into two sheets. Only one will be used.
3. Take the centre part of a sheet and fold it like a tiny balloon, as the head part of the jellyfish. Tie it with a thread, but not too tight. Leave a little space to pour in water.
4. Cut the from the bottom to the

Looks quite convincing!

head to form tentacles. First cut them into thick tentacles, then cut each tentacle into further smaller tentacles.

5. Trim the tentacles randomly to get different length tentacles.
6. Add some water to the head, but leave some air so that it can flow back up. Your jellyfish is complete!
7. Fill the water bottle, add some blue food colouring and put the jellyfish into it and seal it with the cap.

This can act as a great toy for kids and can baffle their minds how the jellyfish always goes up no matter the orientation of the bottle! A great way to teach them the basics of science.

05 DUCT TAPE FIDGET SPINNER

Fidget spinners were massively popular a few years ago and almost everybody had one. Slowly, they became a part of history. They would have been quite useful this quarantine but now they aren't as accessible as they were back then. That shouldn't stop you from spending countless minutes a day spinning the toy. Gather the following things:

- 3 marbles.
- Skateboard bearing (or any big bearing of sorts)
- Duct tape.
- Craft knife

Place a marble in the centre of the duct tape

Attach the marble to the bearing
