

The bearing can be easily obtained at any hardware shop or any similar bearing can also be utilised for this DIY. After you have everything, you can start the procedure:

1. Cut some duct tape pieces to about 3 inches long. Don't allow the duct tape pieces to lose their stickiness, so don't handle them too much.
2. Cut about 6 strips of tape with a width equal to that of the bearing.
3. Now take a marble and put it in the centre of the duct tape strips that you made in the last step. Take another strip and wrap it around the bottom of the marble.
4. Repeat the above steps for the other two marbles.
5. It's time to stick the marbles to the bearing. Position the marbles so as to form a triangle around the bearing and they are at equal distance from each other.

You have created your own makeshift fidget spinners!

6. Wrap a tape string over the whole toy to reinforce it and you are done! You have successfully made your very own fidget spinners!

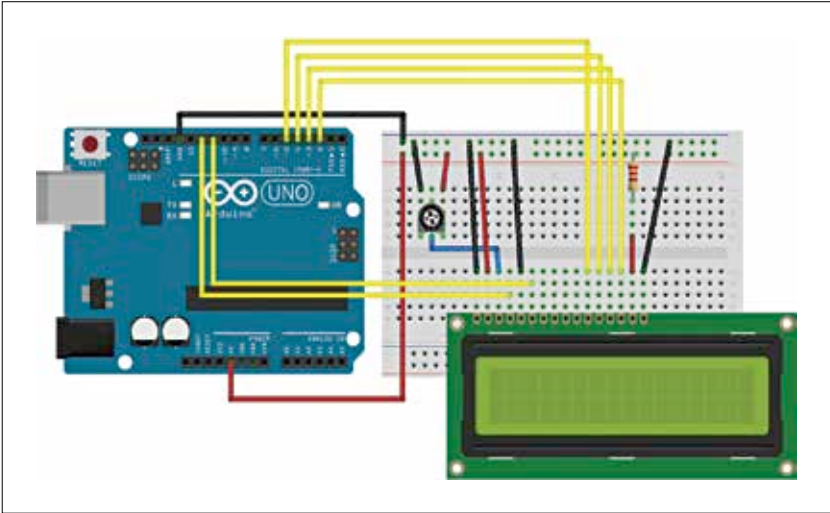

06 FOOTBALL SCOREBOARD

Coronavirus brought the football universe to a sudden halt. From Champions League to the Premier League (Liverpool fans are the saddest), no games are being played and everything is suspended. So, in the meanwhile, create a scoreboard to keep tally of the scores of your favorite matches so far! Here's what you will need:

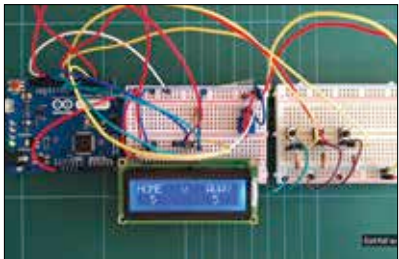

- Arduino Uno Rev3
- Header – 2x23-pin Male (PTH, 0.1")
- LCD Shield Kit 16x2 Character Display

After gathering all the hardware, you first need to connect the LCD shield kit with the Arduino. Use this circuit diagram:

You can also use the schematic diagram shown above.

After the connections are all made, you can test if it is working properly with a sample LCD code: <https://digit.in/FootballScoreboard1>. When you are sure and satisfied with the connections, download the code for maintaining the score: <https://digit.in/FootballScoreboard2>. That's it! You are all set! You have created your very own football scoreboard.

Your homemade football scoreboard is ready!

07 RUBBER CHICKEN SUBWOOFER

You probably didn't miss those high-pitched, funky-sounding rubber chickens, that make a *baa-wwks* sound and can turn any situation hilarious. Well, these rubber chickens can be turned into an awesome sounding subwoofer with the help of an easy to program microcontroller.

The project is a little complex, but a whole lot cooler. These are a list of
