

things you will require to do this:

- Arduino Uno – R3 (Mega or Nano will work too)
- Half-sized breadboard
- DFRobot Audio Analyzer
- 12V Push-Pull Solenoid
- And of course, a rubber chicken

So first of all, since it is an arduino do-it-yourself, you need to do the connections. Check out the diagram on the top of this page.

Now what you will be doing is, you will be controlling the solenoid according to the music that is being played and on certain frequencies, the

solenoid moves in back and forth. So all you have to do is fix the solenoid behind the chicken so that it hits the chicken while moving forward.

To achieve this you can tape it to the back (or front) of the chicken, by taping the sides. Or if you have a 3D printer hand, you can print a holder. Here is the STL file for it: <https://digit.in/RbbrChknWoofer1>. And you can download the Arduino code from here: <https://digit.in/RbbrChknWoofer2>.

Voila, you have your very chicken subwoofer that now *baa-wwks* to your favorite tunes.

Arduino activated rubber chicken subwoofer

08 RGB LIGHTSABER

May the force be with you! This DIY is a must for all the Star Wars fan, trapped behind four walls. Who knows how many Star Wars marathons you have already completed, so it's time to take a break and create your very own Lightsaber, and with custom colours too! Here's what you need to be able to accomplish this DIY:

- Solid Plastic Rod x 1
- Arduino Nano
- DFRobot Mp3 player module
- Bone Conductor
- Protoboard
- Pixie LED
- Push Button
- Pimoroni Resistor Kit
- Micro SD Card
- RGB Rotary Encoder
- RGB Rotary Encoder Breakout
- Wires
- Plastic Rod from Simply Plastics
- Tape
- 9v Battery
- 9v Battery connector

So you need to first set up the push buttons, DFRobot MP3 player and the Pixy smart sensors.

You can get more help here:

- For push buttons: <https://digit.in/pushbuttons>
- For the DFRobot player: <https://digit.in/DFRobot>
