

SECURITY WATCH

Cybercriminals using fakes of popular apps

Kaspersky recently investigated the cyber threat landscape for social meeting apps such as Skype, Zoom, Webex and Slack. The analysis revealed 1,300 files that are using names similar to these applications. With the boom of these video meeting apps amidst the novel coronavirus pandemic, cyber fraudsters are gaining more traction when using similar names to these apps and are able to distribute various cyberthreats under the guise. A total of 200 threats were identified amidst these 1,300 files, the most prevalent being two adware families – DealPly and DownloadSponsor. These are installers that show ads and download adware modules on to devices. Kaspersky also found threats in the form of fake .lnk files. A majority of these were detected as Exploit.Win32.CVE-2010-2568, a malicious code that lets attackers infect PCs with additional malware.

MOBILE WATCH

Motorola Edge+

Motorola recently announced the Motorola Edge+ with a waterfall curved display that is, no doubt, a head-turner. The Edge+ packs a stunning 6.7-inch Full HD+ OLED display with 90Hz refresh rate. Running Android 10, the Motorola Edge+ is powered by the Snapdragon 865 SoC and a whopping 12GB of LPDDR5 RAM. The Edge+ also packs quad rear cameras – a massive 108MP main lens, a 16MP ultrawide lens with a 117-degree FoV, an 8MP telephoto lens with OIS and 3x optical zoom, and finally, a ToF sensor. The selfie shooter is 25MP. Powering this device is a gigantic 5,000mAh battery with 18W fast charging, 15W wireless charging as well as 5W reverse wireless charging. The phone is 5G-enabled and comes with 256GB of non-expandable UFS 3.0 storage. Oh, and there's also an optical in-display fingerprint sensor.

APP WATCH

Filterbox

Ever felt like you spend way too much time swiping away notifications? Here's an app that can help you get a better handle on these pesky, ever-piling notifications. FilterBox is a powerful timeline-style notification manager application from the developer of Clip Stack, Catching Now. The home screen of the app shows a chronological log or history of all recent notifications, whether they are active or dismissed, for up to 30 days. You can customise this and have the app show notifications for a lesser number of days as well. Users are able to easily jump to

any specific notification in the timeline by swiping down on the right side of the screen. Tapping on any notification gives you detailed information about the notification itself, the app that sent it, and more. You can also dismiss or mute push notifications by making cus-

tom rules. You can even apply rules such as hiding push notifications from certain apps using certain words, phrases, time or even RegEx! FilterBox, by default, sends notifications occasionally to tell the user how many messages

it has filtered, however, this too can be turned off. The app is even capable of restoring 20 recent notifications dismissed by the user to the notification tray. In case you accidentally swiped away something you haven't looked at or something important, you can just bring them back. Also, there's no cap on the number of times you can 'revive' a particular notification, as long as it is still within FilterBox's log. The app provides you with analysis and statistics of your notifications by overview and daily view. The analytics page lets users sort out apps based on name, total notifications, or how many times the push notifications were filtered by FilterBox. The app even has a dark mode which can be scheduled or turned on/off permanently. The app is free for 90 days and then costs \$3.99 to keep it after that.

Arrive – Package Tracker

Arrive is an app that lets you track all your orders in one place. It achieves this by syncing with your email to track all orders. You get live updates and can also view them on a live map.

NeuralCam

NeuralCam is a powerful night mode camera app that allows iPhone users to shoot Night Mode videos and pictures even if their phone doesn't have a dedicated Night Mode. It works across all cameras, including ultrawide and telephoto.

Covve Scan

An AI-powered business card reader and scanner that accurately scans cards, and adds the cards' details to your phone's contacts with one tap. It also enables users to add notes, tags or location to the card.
