

JARVIS by tweaking its framework. Earlier used by the central and state governments, as well as businesses, to monitor objects, activities and perimeters, the JARVIS camera is now assisting authorities to monitor social distancing and the lockdown implementation across several cities in India. Staqu has also further modified JARVIS in order to efficiently carry out contact tracing. JARVIS is capable of detecting masks and screening body temperature above 37° C by utilising thermal cameras as well. The camera has a range of up to 100 meters and can identify numerous people simultaneously. Real-time alerts are sent to the concerned authorities when a concerning issue is spotted by the technology. Mr Atul Rai, CEO and Co-founder, Staqu, divulged to Digit, “Our technology finds its use at hospitals, centres of essential services, relief distribution centres, and other crowded areas, wherein effective manual monitoring and simultaneous scanning are not possible”.

According to Staqu, JARVIS can easily be implemented in the existing surveillance systems in a city, a locality or particular premises. The technology even works in the absence of CCTV cameras and can be leveraged via the JARVIS streaming app. The surveillance of any hotspot can easily be automated by streaming the feed using a smartphone. The thermal camera also works in locations with ambient light where other thermal cameras usually fail. Rai believes, “JARVIS has significantly reduced the time and scope of error via automated detection. Our solution is able to scan through gigabytes of streaming videos to give an actionable insight and allows authorities to general real-time alerts via AI and Computer Vision. The biggest advantage is that it removes human intervention in the early stages of detection”. Staqu’s AI-powered video analytics solution is already used by police forces in eight states and UTs in India including Uttar Pradesh, Punjab, Haryana, and others.

AGRIBAZAAR

Delhi-based agri-tech startup, AgriBazaar has developed an e-mandi

(e-market) for farmers and food processing companies in the light of the lockdown which has caused physical vegetable markets to remain shut. The food supply chain was buffeted quite a bit due to the closure of APMC markets, scarcity of labour and disruption of transportation and logistics. Therefore, AgriBazaar developed an app which provides an electronic mandi that attempts to closely mirror a physical one. The app allows farmers to sell fresh produce online from the safety of their homes which, in turn, helps them abide by social distancing norms as well. The app also helps reduce the crowding in physical mandis and avoids farmers having to make regular trips to these markets.

Amith Agarwal, co-founder and CEO, AgriBazaar told Digit, “We are the first full-stack agri-tech platform that has replicated a physical mandi into a digital one. Every facility that a small farm-owner and buyer enjoys in a physical mandi near his village is available at the click of a button on a mobile phone”. The app is simple, the farmer can find a buyer on the app or vice versa and then the company’s on-ground trained staff will be tasked with picking up the produce from the farmer’s field or home. The on-ground staff wear face masks and carry hand sanitiz-

ers, and are also trained to maintain social distancing. Agarwal stated that the pandemic has fast-tracked the adoption of the app by farmers and buyers. According to AgriBazaar, the digital transactions on the app are simple and user-friendly for farmers as well as buyers. Agarwal is also appreciative of the government’s vision to unlock the agriculture and allied sectors during the lockdown. AgriBazaar works with over 120 FPOs (Farmer Producer Organisations) in India and also connects around 2,00,000 farmers with produce procurement agencies, food processing companies, and the state governments.

INNACCEL

Bengaluru-based, MedTech startup, InnAccel Technologies have developed a completely non-invasive ventilation (NIV) system called SAANS Pro for ICU use with COVID-19 patients. According to the company, this is India’s very first NIV system and can be used to treat patients with hypoxemia (low level of oxygen in the blood). The SAANS Pro has been specially designed for India and also comes with a helmet interface which prevents the virus from being transmitted to the caregiver. The helmet can be either disposed of or sterilised later for repeated usage. SAANS Pro comes equipped with all the adequate features that are typically found in an ICU including pressure control, flow control, oxygen blending and inbuilt compressed oxygen supply. The device can function without electricity, is portable and can be operated without a trained respiratory therapist, as per the company. InnAccel stated in a release that SAANS Pro can be used to stabilise critical patients with merely 20 minutes of training. The prototype is currently being tested by doctors and if approved the company can produce 5,000 units of SAANS Pro per month.

Another device developed by InnAccel is VAPCare, an automated and closed system for removing oral secretions in ventilated COVID-19 patients. The company was inspired

AgriBazaar is an e-mandi which helps farmers sell their produce online
