

US release 'UFO' videos

The footage shows mysterious, wingless aircraft traveling at hypersonic speeds. <https://digit.in/may20-67>

Dirty coal actually good?

The tar we use in roads might someday be useful as a raw material for a variety of high-tech devices. <https://digit.in/may20-68>

LOCKSPORT

Picking locks is a pretty fun hobby and is called locksport. Here, we will be showing you how to pick some common kinds of locks, which can be helpful in all kinds of situations and is actually a valuable life skill. Please use this knowledge responsibly.

Luggage

One of the dumbest ways to access locked luggage, if it has a zip, is to simply ignore the locks and attack the zip. You just need a ballpoint pen, force it through the zip at any point in the luggage, and then unravel the rest of the zip. This common trick is used by thieves in public transport, and even baggage handling staff at airports. Briefcases, trolleys, and bags have three number combination locks that have been forgotten. Now, these typically have either vertical or horizontal dials that need to be turned to arrive at a particular combination, which allows the luggage to be opened. The default combination for most brands is 000, so try that. Next, there are

two approaches for horizontal dials or vertical dials. For the horizontal dials, look sideways and rotate the dials till a tiny aperture or slit below the dials open towards you. Align all the three slits, and then simply rotate the dials clockwise by three numbers to open the lock. So if the combination is 666, then the number to open will be 333. The vertical dials are more secure, and require you to apply a steady pressure on the button or lever that pops the lock open, and actually work through all the combinations. There are 999 combinations, but you simply need to work up from 000 or work down from 999 by constantly moving each dial, and you should be able to crack the combination within five minutes.

Sliding glass doors

Typically found in balconies or patios, getting locked out of sliding doors can be pretty irritating. The indignity of getting someone inside the house to let you out of the situation is just unbearable. Like most of the methods on this list, this approach requires a bit of practice. However, bear in mind that the more this is done to your door, the weaker the security becomes.

The idea is to exert force perpendicular to the direction in which the door slides open. What you have to do is get some leverage, either along the frames of the glass door, or using the friction on the glass itself, and push either upwards or downwards, depending on the type of locking mechanism implemented on the door. For the smaller latches, the door simply snaps out of the locked position, allowing you to slide it open. Larger latches require the whole door to be derailed, which again needs to be forced back into the rails before the doors can open. If your home is on the ground floor, or the doors are in a balcony just below the terrace of the apartment complex, there are some ways to secure sliding doors from easy entry by miscreants. These involve placing small wooden pegs or nails along the top or bottom rails, to prevent the doors from being lifted. Additionally, the doors can be secured with locks, and a key hidden somewhere that only you are aware of.
