

Leaked Apple AR Headset controllers

It's no secret that Apple is interested in AR. Rumours that Apple has been working on an AR headset have been around for a while now. Well, it looks like Apple is pretty close to being finished if new reports are to be believed.

According to MacRumours, a leaked build of the upcoming iOS 14 comes with what looks like a remote or controller for an AR or VR headset. In other words, a controller for a Mixed Reality headset.

Another thing that's easily noticeable is the controller's resemblance to the controller used in the HTC Vive Focus. Apple have worked with HTC in the past, and Bloomberg had actually reported back in 2017 that the two companies were working together on an AR headset.

9to5Mac found code in the iOS 14 beta back in March which showed that Apple was working on a new AR app. Dubbed "Gobi", the app appears to be targeted only at iPhone users and focuses on enabling AR experiences when using the Apple Store, among other things. The thought is that Apple could be using the same app to test the MR headset as well.

Precision Health Smart Toilet

We can't live without toilets, that's a given. For some nations they're a big deal, take Japan for example, their toilets are next level, with heated seats, background music, and automatic water sprays. A team of researchers have taken even that to the next level, and have created what can only be called the Sherlock Homes of toilets. Enter the Smart Toilet, which is a self-contained system that operates automatically with the help of pressure and motion sensors.

Everything is contained in the toilet seat, which is mounted onto a conventional western toilet. Once it's fit, it can monitor the health of those who use the toilet by scanning faeces and urine for various factors such as consistency, glucose, red-blood cell count, colour and more.

With the information it gathers, the device can detect various conditions, including chronic constipation, irritable bowel syndrome, prostate cancer, kidney failure and more. This is invaluable for individuals who are genetically predisposed to these conditions and can catch them early on. The seat also has a little camera on the underside, which can not only see your excrement, but also your bottom. This camera can actually identify people using their bottoms, which is required for it to be able to match data to different users.

Wattsugar Pro

If you're someone who owns multiple Apple devices, then we have just the charger for you. The Wattsugar is a 60W USB-C charger and powerbank that'll work for each and every Apple product. Even better, you can charge all of them at the same time. The ability to charge multiple devices comes with the Wattsugar Pro, which features dual ports for USB connections. As a power bank, the Wattsugar comes packed with a 5000mAh battery. Wattsugar is also certified for MFI Qi quick-charging. When it comes to inter-device ecosystem integration, nothing comes close to Apple, however, on the charging front, it's a whole different story, requiring you to carry a multitude of plugs, wires, adapters and dongles. Wattsugar aims to solve that problem by bringing the number of chargers you'll need down to just the one. This one. The Pro variant can charge your laptop, phone (or 2 even phones), an Apple Watch, and your AirPods, at the same time. The Apple Watch and Buds sit snugly on the charger for Qi quick-charging, without interfering with the wires.
