

A slice of the moon

Interested in owning a piece of the moon? Well, it's going to cost you a quarter of a million dollars. 'The Perigee', a piece of the largest-known lunar meteorite, NWA 5000, or NorthWest Africa 5000, crashed in the Sahara Desert in 2007. The

piece, currently on auction, is sized at 9.5"x8.5"x0.3" and weighs close to 1.5 pounds. It contains metal that's close to 4.5 billion years old!

This particular rock is part of 7 different slices carved from the meteorite, each being meticulously examined and preserved.

Each piece of the moon comes with its own custom Pelican case, a safety deposit box insert, a metal ID tag and a certificate of authenticity. This particular piece is the last of the seven, with the remaining six already being in possession of rich tycoons around the world.

BMW 3T Bicycle

The pandemic forcing people to stay indoors has become a bit of a theme now, you've probably already seen plenty of mention of it in the magazine so far. One of the good things we've noticed about the pandemic is that with everybody stuck at home, nature is slowly clawing its way back. Even within just a few weeks of lockdown, there have been significant changes around the world. Just goes to show you how resilient the planet actually is. To that end, once the lockdown ends, we should strive to keep our carbon footprint as low as possible. In addition to transition to electric cars, BMW is taking a step further with a limited edition bicycle. Featuring a futuristic design, one might think they are designed strictly for roads, but according to BMW these are all-terrain bicycles. The bicycle has been made in collaboration with Italian bike manufacturer 3T, and is actually based on one of their models, the Exploro all-road bike. The bike features a carbon frame, with the world's lightest carbon aero cranks made at 3T's carbon factory. The fulcrum alloy wheels are fitted with Schwalbe One Speed tires, which are known for their grip. The saddle is also an exclusive Brooks leather saddle, and comes with Brooks leather grips as well. The BMW 3T bike starts at \$5499.

Virtual Convocation

Thanks to the pandemic, everybody is stuck at home. For the right reasons of course.

Unfortunately, due to this, schools, colleges and universities across the planet have had to shut down, this included the cancellation of graduations and convocations for many. Teaching has moved online with video conferencing and online classrooms. There's no such solution for graduation ceremonies unfortunately. Or so we thought. The Business Breakthrough University in Tokyo, Japan pulled out all the stops to make sure their students got their convocation by taking video conferencing to a whole new level. Instead of having students appear physically to take their certificates, the university used remote controlled life-sized robots equipped with tablets with the students' faces via video conference to attend the ceremony.

ANA Group's "Newme" mobile robots were used for the ceremony, which are human-sized and move around on wheels. The robots were even dressed in graduation gowns and caps. The entire convocation was conducted by a few administrators and four students at the Grand Palace hotel in Tokyo. The university's president, Omae Kenichi was also present at the venue to personally award degrees to the students' avatars. What a thing to be able to brag about, "I received my degree remotely via video conferencing as a face on a robot!"
