

Siri

Make Siri work for you

Aditya Madanapalle |
aditya@digit.in

SIRI IS NOW SUCH AN INTEGRAL PART OF THE IOS EXPERIENCE that only the early users remember when she was an app released by an independent developer.

CHOOSE WHAT SIRI CALLS YOU

By default, Siri will call you by the name entered into your Apple ID. However, you can make Siri call you anything you want, such as "boss". To do this, first unlock the phone, then say "Hey Siri, call me boss". Siri will prompt you to confirm the new name, then save it with your contact details. From now on Siri will call you "boss" during all your interactions with her.

CHANGE SIRI'S VOICE AND LANGUAGE

If you are a long time user, you are probably still using Siri's default voice and might have missed the update

where they introduced Indian accents. Note that the voice is a different setting from the words used, which is decided by the language. Go to Settings > Siri & Search > Language and change it to English (India). Then go to Settings > Siri & Search > Siri Voice and change it to Indian. You can additionally pick Male or Female genders. Note that to download a new voice, you will have to be connected to a wifi network.

REPLY TO WHATSAPP WITHOUT ACTUALLY OPENING THE APP

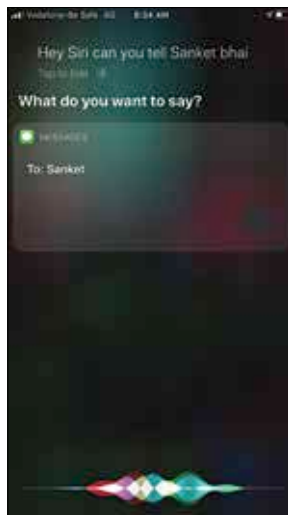

This is a really cool feature that allows Siri to read out new WhatsApp messages to you, and you can even respond to them. Just say, "Hey Siri check new WhatsApp messages"; and Siri will read them all out one by one. It will also prompt you to reply to each before moving on to the next one. Do note that Siri does not distinguish between messages sent in groups and messages sent directly to you, so you might want to check in on that before sending off a voice response. The same feature works on Telegram as well. Just be wary of forwards from Unkils, as Siri will read the whole thing out without pausing to take a breath. The phone needs to be unlocked for this

feature to work, and the first time you use the command, Siri will ask you permission to read messages.

USE SIRI TO ROLL DICE

Siri can be used to flip a coin or roll a die as well. The best thing is that Siri actually allows you to roll polyhedral dice, which can be incredibly useful for your RPG campaigns instead of having to download an app or heading to a web page. Just say Hey Siri, roll a 20 sided die and Siri will spit out a number. Do note that rolling two dice at the same time is not possible, and neither can you use the short forms of d8, d12 or d20.

This is what Siri showed us when we asked her to roll a fourteen sided die. Siri got that bit wrong, but we found out that she understands the use of the word "bhai".

GET NUTRITION INFORMATION

Just like Alexa, Siri allows you to count the number of calories in a dish that you are about to devour. When asked for the calorie count, Siri actually provides more detailed information for each dish, such as the amount of fat, sodium and carbohydrates.

THINGS YOU MIGHT WANT TO ASK SIRI

Try asking these questions to see the funny side of Siri

- Hey Siri, are artificial intelligences an existential threat to humanity?
- Hey Siri, which watch face do you like?
- Hey Siri, who is the best assistant?
- Hey Siri, open the pod bay door.
- Hey Siri, can you stop time?

When relevant, there are further breakdowns for the type of component, such as saturated fats, monounsaturated fats and polyunsaturated fats. It also gives you a percentage of the recommended value for the day for that component. Unlike Alexa though, the nutritional information queries did not work on any of the Indian dishes that we tried.

USE WOLFRAM ALPHA

To make sure that Siri uses Wolfram Alpha for the results you want, simply say "Hey Siri", and when Siri responds with an "I'm listening" say "Wolfram," followed by your question. You can use this for complicated maths, finding out the species names of animals, finding out the probability of an event, convert words to morse code and all kinds of other geeky things that you can do with Wolfram Alpha. Siri automatically chooses Wolfram Alpha over Google for some types of searches, but this is not set in stone as it keeps changing over the years.
