IP RATINGS DECODED

Exploring the IP Rating system in smartphones and what it means

Dhriti Datta | dhriti@digit.in

A

s smartphone prices are burgeoning, consumers have begun expecting more luxurious

features from their smartphones. For good reason too, especially when some smartphone enthusiasts dole out close to a lakh for premium phones! An IP rating is among one of the expectations, especially for flagship and premium smartphones,

Water resistance is a sought-after feature in modern smartphones

and some mid-range ones too. After all, an IP rating can prove to be the saving grace, allowing your phone to survive through unexpected showers or accidental drops into the, ahem... toilet bowl. This unfortunate incident has actually transpired with one of us here at the Digit test lab. Naturally, we

all wish all smartphones were truly waterproof. We wouldn't be faced with trivial worries of our phones dying out due to an accidental dunk or occasional splashes. Unfortunately, that is not the case.

In 2020, smartphones across several budget points come equipped with an IP rating, which makes them water-resistant and not waterproof. You may often see smartphone manufacturers such as Samsung, Sony, and Apple use their IP rating as one of their foremost selling points. While smartphones today are quite rugged and can probably shake off splashes and more in most instances, their water-resistance isn't as straightforward as you think and is often lost in the fine print in smartphone websites and advertisements. Intrigued? Read on to find out all about the IP rating system in smartphones and why modern-day smartphones are
