Building careers in a COVID-19 reality

Exploring job opportunities in light of the game-changing ramifications of COVID-19

Dhriti Datta | dhriti@digit.in

There's no way to sugarcoat the reality we're living in at the moment. The COVID-19 pandemic has thrown a major curveball that has transformed the landscape of jobs completely in most parts of the world. Lockdowns and obligatory social distancing have disrupted industries, startups, public and private offices as people are staying indoors to avoid spreading the contagious disease. However, the question needs to be asked, how do we align ourselves with the current reality and come out as winners? In numerous ways, the pandemic has demonstrated the power of technologies such as cloud, big data, AI and ML. It is constantly helping

businesses and employees realise new ways of using technology to do their jobs and grow in it too. Like demonetisation once did, the COVID-19 pandemic is also spurring digital transformation in India as well as other developing countries.

Almost every industry has been forced to restructure in order to keep up with the new realities that are emerging in the workplace. Employees have been instructed to work from home, large gatherings of people are not permissible, and business trips which include taking planes, staying at hotels, and dining out have been put on hold for the foreseeable future. These trends, most probably, will even continue after the outbreak has been defeated for quite some time. Some companies such as Amazon, that are seeing a major surge in demand, are creating jobs in our country. According to a recent report, Amazon India announced that it will be generating approximately 50,000 seasonal jobs. This comes as a relief since the lockdown has caused a staggering number of people to lose their jobs in our country. According to the latest data, over 12.2 crore people in India have lost their jobs during the pandemic in India. So, it is best to be

prudent and prepare ourselves for the new work culture and also get used to building our careers in a COVID reality. With that being said, let's take a look at some jobs that are in-demand during the pandemic.

JOBS AND CAREERS IN-DEMAND DURING THE PANDEMIC

While almost every industry and sector will find ways to transform during this pandemic, the following jobs and sectors are well-poised to transform successfully. Not only this, these jobs and sectors will also transform faster and create larger employment opportunities.

Healthcare

This one is obvious. With the rapid spread of the novel coronavirus, healthcare workers are absolutely integral to the smooth functioning of society at this point, more than before. At the time of writing, the infections in India are over 1,45,000 and hospitals are brimming over. Registered nurses are most in-demand since they are the ones who closely monitor patients and their recovery process. Healthcare workers are also working in airports to help with screenings. Respiratory therapists are also highly in-demand due to the respiratory ramifications of this disease. The entire healthcare sector, which comprises hospitals, medical equipment manufacturers, diagnostics, pharmaceuticals, and telemedicine is poised for inordinate growth during this period. Physicians are also enlisting their services on apps such as Practo for 24-hour medical assistance in times when people don't want to visit clinics and hospitals for routine check-ups and other health-related concerns.

Researchers and scientists

Scientists and researchers are essential for testing and reviewing lab data related to the novel coronavirus. More specifically, virologists and microbiologists are in high demand since they are integral to the development of vaccines and new therapeutics. Scientists and researchers across the world should band together and relay all their find-
