ings related to the novel coronavirus to each other. According to Science Magazine, many scientists are using Slack to communicate their research and findings with their peers across the globe. Prime Minister Modi himself asserted the importance of research and

technology during this time. On May 11 when Technology Day was observed, he tweeted, "Today, technology is helping many in the efforts to make the world free from COVID-19. I salute all those at the forefront of research and innovation on ways to defeat Coronavirus. May we keep harnessing technology in order to create a healthier and better planet".

Cloud computing

The outbreak has definitely brought cloud technology to the forefront with almost every organisation utilising it in order to collaborate and share data for work. Cloud computing is witnessing exponential growth since it is affordable, easy to use and is also highly customisable to needs in terms of scalability. Cloud also allows monitoring of resource consumption which is invaluable for some businesses. The cloud may have been a frivolous expense for many organisations years ago, however, today it is an indispensable necessity to many. It has emerged as the backbone of all IT infrastructure, especially now as the pandemic rages on. Naturally, due to the increase in demand for cloud computing, the demand for employees in this sector is increasing as well, as

the world proceeds to swiftly move into the cloud era. Jobs such as cloud architects and cloud IT admins will likely see an exponential push.

Data analysts and specialists

Data is often deemed as the fuel of the 4th Industrial Revolution and it is a critical asset for almost every company out there. With the ongoing pandemic, this is even more true since data can help companies understand new business trends and shifting customer needs. Therefore, it is integral for employees to be data literate. Data analysts and specialists are equipped with skills to make sense of data and consequently make better decisions because of it. Additionally, during the pandemic, there's also a dire need for people who can make sense of data related to the disease and come up with novel solutions. The job opportunities for data analysts, engineers, specialists and scientists were already growing steadily before the onset of the pandemic. However, the pandemic has acted as a catalyst for further growth as there has been a massive surge in the need for intelligent data and also data usage.

Content creation

Direct-to-consumer streaming services and content libraries such as Netflix, Amazon Prime, Disney+, YouTube and more were already seeing a massive increase in popularity in India and across the globe. Due to the pandemic ushering everybody indoors, the demand for unrelenting content has skyrocketed. All major networks and studios are looking into launching their own streaming platform to meet the demand. Additionally, faster and cheaper data has also made content consumption one of the most sought after methods to pass time. Therefore, the demand for content creators is growing exponentially and is expected to stay high even once the pandemic dies down.

Cyber security

With many companies opting to shift to remote working permanently even after the COVID-19 outbreak, com-

pany data may be slightly more unsafe since employees will rely on personal Wi-Fi networks which are less secure. Therefore, cyber security has become much more critical during this phase and the demand for security architects and ethical hackers has grown. The use of blockchain and application program interface (API) will also increase to limit the occurrences of cybercrime, financial fraud and data theft.

Robotics

Robotics is moving at an extremely unprecedented pace during this pandemic since many industries will benefit from its applications. Robotics is at the forefront of innovations that help counteract the negative impact of the novel coronavirus outbreak too. Drones are being used to survey cities, hospitals

and other buildings, robots are being used to scavenge roads and buildings for those violating social distancing norms, and robots are even being created to monitor the vitals of COVID-19 patients to minimise exposure to other humans. Manufacturing plants are also using robots to help carry out processes which would have otherwise been halted due to the pandemic.

Digital and social media marketing

Since the consumption of information has almost entirely shifted online, digital and social media marketing has become integral for CMOs. Online marketing can help bring down the marketing dollars being spent and also drive greater ROI from marketing. As a result, there is a greater demand for digital brand managers, content and SEO specialists, email marketing specialists, and others. People who are proficient in digital marketing skills can overhaul the image of brands and therefore, become attractive hires.
