

Coronavirus and global warming
Harvard educators answer questions on the relationship between the pandemic and climate change. <https://dgit.in/jun20-136>

The impact on forests
Climate change is resulting in forests with younger trees, a trend that's expected to continue. <https://dgit.in/jun20-137>

EARTH

Giant Pandas extinct in the wild

NOVEMBER 17, 2052 |
TEMPERATURE: 2.1°C+

China, the world's largest democracy, reports today that scientists found the remains of the last group of Giant Pandas that were living in the wild. Although not yet confirmed, it's suspected that the family died of dehydration.

Koalas and Quokkas are gone

SEPTEMBER 18, 2083 |
TEMPERATURE: 2.8°C+

In a massive unseasonal bushfire rampage across the state of Western Australia, the Caversham Koala sanctuary has been burnt down. The last surviving 30 Koalas were housed here, and it's been confirmed that all of them perished. Sixteen people died trying to protect them, and 23 more are seriously injured. The sanctuary also housed the last surviving family of quokkas – the world's happiest animal – which were also tragically killed. The Koala Sanctuary had just celebrated its 30th year anniversary last year.

Amazon burnt down

APRIL 11, 2134 |
TEMPERATURE: 3.3°C+

The last of the Amazon forest caught fire last week, and today we have the first pictures of the devastation left behind. Not one living tree is visible, there's no water, and scientists estimate that all of the remaining species have perished. Instead of sharing the destruction, we've decided to put up a picture from the internet archive dated 2016, of the beautiful Amazon.

Sea level rise

FEBRUARY 4, 2175 |
TEMPERATURE: 4.3°C+

Over 60 million people (half the world's population), are on the move again as hurricanes batter the coastal shores of countries globally. From Afghanistan to Austria, and Burundi to Bhutan, the coastline is being battered. Sea levels have risen to 14 metres over pre-industrial average!

Population falls under 50 million

OCTOBER 10, 2222 |
TEMPERATURE: 4.8°C+

As per the annual census that's undertaken in September, the world officially has under 50 million people, and still falling. Over 90% of those people live here in Canada, while the rest struggle on in underground bunkers across what's left of the globe. Land masses are ravaged by acid rain and the air is thick with Hydrogen Sulfide. Crops are dying and it's only Canada's hydroponic project of 2036 that continues to feed the masses.

Note: This is based on a runaway greenhouse effect that scientists think could happen if we allow global average temperatures to rise above 2 degrees C in the next 20 years. We have taken some creative liberty, and sped up what scientists think could happen over 2,000 years into a 200 year timeframe. 🚩
