Teardown: iPhone SE 2020

A bit of this, and a bit of that

Dhriti Datta | dhriti@digit.in

A couple of cross-compatible parts

Upon opening up both the iPhone SE 2020 and the iPhone 8 side by side, you will notice some superficial similarities as well as some cross-compatible hardware parts! As per iFixit, the Taptic Engine as well as the main speaker are identical on the iPhone SE 2020 and the iPhone 8. This certainly means that repairs will become more accessible since the parts will become more readily available and replacements should also become cheaper.

A slightly underwhelming battery

The battery capacity remains to be the same as the iPhone 8, at 6.96Wh which is slightly more than the original SE's battery capacity, coming in at 6.21Wh. The SE 2020 doesn't bring back 3D touch, however, the battery size is kept the exact same to probably keep the price point of the phone low. Also, even though the batteries of the iPhone SE 2020 and the iPhone 8 are the exact same size and capacity, they are not interchangeable since the connector has changed on the new SE.

The "parts bin" phone

The iPhone SE 2020 seems to borrow bits and pieces from multiple Apple products from the yesteryears which is great, since it ensures lesser wastage. It takes the A13 Bionic SOC with a third-gen Neural Engine straight from the iPhone 11 lineup, which is excellent on a cheaper iPhone like this one. The 4.7" Retina display with a 1334 x 750 resolution comes from the iPhone 8, the 12MP wide-angle camera and 7MP selfie camera could be borrowed from either the iPhone 8 or XR, the Home button with Touch ID comes from the iPhone 8 again, and the Gigabit-class LTE with 2x2 MIMO and 802.11ax Wi-Fi 6 with 2x2 MIMO + Bluetooth 5.0 + NFC is found in the iPhone 11.
