

Espresso Veloce RS Black Edition

Super Veloce is a company that's known for making F1-inspired espresso machines. Their latest creation is inspired by the iconic Porsche 911. Heck, it looks like it was pulled straight out of one! The design borrows from the iconic flat-six engine used in the air-cooled Porsche 911s from the 964- 993-generation. The espresso makers are made using carbon fibre, titanium, anticorodal 6082 T6 and 7075 aluminium alloy.

This makes them pretty darn heavy at a whopping 21kgs, so if you do decide to get one, you're most probably not going to be moving it around. Speaking of actually getting your hands on one, this espresso maker does not come cheap, priced at around \$11,500. However, it's definitely cheaper than actually getting your hands on a Porsche 911, which has become increasingly expensive over the years.

Espresso Veloce is only going to be making 993 of these espresso machines, for obvious reasons. All of the company's design and framework is being carried out in Johannesburg, South Africa. This is where they've done all of their design and framework since being founded by industrial designer Paolo Mastroguiseppe.

Audi A8 L

Audi has released the latest version of its armoured A8 L Security in Russia. It was a very low profile launch, without as much as a press release. This is understandable considering the kind of people that would actually use such vehicles. You don't want its security features to be out in the wild for anyone to see.

However, we do know some of the A8 L's security features, such as the standard VR9 bulletproofing and glass with class 10 protection. This means that occupants of the car are safe from sniper fire, rapid-fire and even

hand grenades. The A8 L also comes with a host of other hardware additions including an intercom system, an armoured box in the car's trunk, a secondary battery, and fire extinguishing nozzles under the car.

The car can also run at 50 mph on flat-tires for up to 50 miles and has an on-board pyrotechnic system that rips doors off if they happen to get jammed. The car also has a fresh-air system which kicks in if the system detects any chemical hazards in the car. All of the additional hardware makes this car pretty heavy at 3875kgs, but it can still do 0-100 in just 6.3 seconds. The car is priced at around \$750,000.

iPhone 11 Pro Cyberphone

Drawing inspiration from the Tesla Cybertruck, Russian luxury brand Caviar has unveiled the iPhone 11 Pro Cyberphone which also has a Billionaire version which features a pure silver and gold body. Other exclusive design features in the Billionaire edition include the Caviar crown, a plate with the brand name, side inserts, and the CYBER inscription on the blacked titanium part of the phone, all of which are made

with pure 750-content gold. The pure silver and gold body doesn't mean that the phone isn't protected, the phone comes equipped with body safety features to ensure that the screen is protected from mechanical damage. There's only 900 of the iPhone 11 Pro Cyberphone Billionaire edition, and while the regular edition is already pretty pricey at \$5000, the Billionaire edition retails for much higher at \$19,900. Thankfully, it's not a billion dollars.
