

Fuller Moto 2029

Based on the iconic French motorcycle, the 1929 Majestic, Fuller Moto's motorbike is a futuristic interpretation of the Majestic and what it would look like 100 years into the future. The French motorbike, when it first launched in 1929, was considered ahead of its time with its torpedo design. The recreation by Bryan Fuller and his team at Fuller Moto features the

1929 Majestic's torpedo body design, hub-centric steering, and sleek lines because futuristic has to have those sleek lines, you know. Of course, the recreation uses the best of modern-technology, which was used to create a lot of the stuff that couldn't be hand-crafted. Thanks to this, the 2029 features light-weight 3D-printed titanium parts and transparent polycarbona wheels.

It also features an electric powertrain. Yep, this version is electric, and offers a range of 100 miles and 78 ft-lbs of torque. This isn't a production vehicle, it's a one-off and isn't for sale. It can, however, be seen on display at the Haas Museum's Custom Shop where the Fuller Moto 2029 will make its debut.

Nissan GT-R50

To celebrate the 50th anniversary of the Nissan GT-R, Nissan and Italdesign collaborated to create the GT-R50, which, as described by Nissan's design boss Alfonso Albaisa, is what a GT-R would look like "without limits". The two companies first came together to design the GT-R50 in 2018, and now finally, the first production example of the \$1.1 million car has been revealed, and we have to say, it looks amazing.

Based on the R35 Nissan GT-R Nismo, the limited edition GT-R50 has been hand-built by Italdesign. It's powered by a 3.8-liter twin-turbo V6 engine which has been re-tuned to dish out even more power. According to Nissan, the GT-R50 has 710bhp on tap. This was achieved by replacing the GT-R's turbos with two GT3 units which are competition grade. The GT-R50's six-speed dual-clutch gearbox and the driveshaft were also amped up to pump out more power.

The GT-R50's design was created in Nissan's San Diego studio, and it's a futuristic version of the exisitic R35 GT-R. All of the GT-R50s are being manufactured in Italy and the final assembly takes place near Turin, in Italdesign's facility. Only 50 of these cars will be built, and the first of them will reach customers later this year.

Urwerk UR-100 Gold Edition

Watchmaker Urwerk released a gold edition of its UR-100 time-piece in celebration of Star Wars Day, which came around on May the 4th. The UR-100 Gold Edition is the fourth edition of the UR-100, which previously had a steel finish, a black-coated steel finish and a gunmetal finish. The fourth edition, obviously, features a gold finish, inspired by the iconic droid C3PO. The case is made out of a solid block of 18k 2N yellow gold, and its surface is satin-finished, inspired by C3PO.

The UR-100's time display is under a domed sapphire crystal, that's also a tribute to space exploration, and there are a combination of rotating satellites that display the hours and minutes along with some more interesting stuff such as the rotation of the earth in 20 minutes and the revolution of the earth around the sun in 20 minutes. The watch uses the brand's in-house 12.01 automatic movement with power reserves of up to 48 hours. The UR-100 Gold Edition is a limited edition with only 25 pieces in existence each priced at about \$60,000.
