

SECURITY WATCH

New macOS malware spreads through Google search results

A new malware was discovered by cybersecurity company, Intego, that distinguishes itself as a Flash Player update installer. The malware is being distributed via webpages that are shown in Google's search results to bypass Apple's security measures. This method of distributing the malware also seems to go completely undetected by most antivirus software. The company found that Google searching for the exact titles of some YouTube videos could lead the user to a page that prompts them to install the updated Flash Player. The Flash Player updater, however, is a Trojan horse. The malware actually does install an Adobe-signed Flash Player but it is also designed to download and install additional unwanted packages containing adware and spyware.

MOBILE WATCH

ASUS ROG Phone 3

The ASUS ROG Phone 3 is officially launching in July, as confirmed recently by the company. The highly-awaited phone was listed on Geekbench and AnTuTu, spotted on TENAA and was also leaked in a hands-on video. According to the leaks so far, the ROG Phone 3 will possibly feature a 6.59-inch FHD+, HDR10+ certified display with an AMOLED panel. The screen also has a 144Hz refresh rate. The phone will most likely be powered by an overclocked Qualcomm Snapdragon 865 SoC with an octa-core CPU and an Adreno 650 GPU. As for memory, the phone will likely be coming in 12/16GB RAM variants and 256GB/512GB/1TB internal storage variants. It will also boast a massive 6,000mAh battery with support for 30W fast charging.

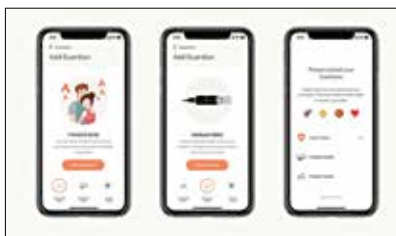

APP WATCH

Argent

Storing your own crypto assets can be a hassle since you have to securely store private keys, understand gas fees, and navigate through the seemingly complex waters of crypto or DeFi (decentralized finance). So, the need for a solution to store and recover crypto assets is rather apparent. Argent Wallet, an Ethereum non-custodial wallet is perfect for those new to crypto or DeFi. It comes with an array of built-in recovery tools and accessibility features and is available on both Android and iOS devices. Argent is a non-custodial Ethereum

wallet where the user is in complete controls of the keys unlike what happens in a centralised model. This means Argent cannot initiate any transaction without the user's authorisation. Argent also lets users access some popular DeFi tools such as Mak-

er and Compound to either borrow or earn interest on cryptocurrencies.

When it comes to security, the Argent Wallet has two levels of protection, one on the user's device itself

and the other in the form of a 'smart contract'. The phone security is on par with renowned banking apps and it prevents attackers from accessing the app with malware or most other malicious methods. The wallet's private key, as mentioned before, is only accessible by the user and is encrypted inside the smartphone. Due to this, there is no need for a 'seed' or recovery phrase, which enhances security. The 'Smart contract' method leverages the potential of Ethereum to provide unique security features. The user's funds are held by Argent's smart contracts and cannot be tampered with by attackers or even Argent themselves. Only a 'Guardian', an account on the Ethereum blockchain, that the user gives exclusive permission to can recover the wallet in case of device loss.

Wavelet

Wavelet is an advanced equalizer that hosts a whopping 2,400 precalculated presets for numerous headphone models and also hosts a ton of other features such as an AutoEQ, bass booster, virtualizer, etc.

Lockscreen Widgets

This app allows you to add widgets to your lock screen. You can add one widget per lock screen page and can also reorder the pages as you see fit. The app allows you to add a plethora of widgets but is a paid app.

Acture

Acture is a digital wellbeing app that asks you why you want to use your phone every time you pick it up. It adds some self-accountability since you can review the reasons you've given later on.
