

Tinker friendly code

In the early days, it was easy for users to get their hands dirty with the code. Why should it be different now? <https://digit.in/jul20-111>

Firefox Replay

Firefox has introduced a new tool that allows developers to record and replay code execution in individual tabs <https://digit.in/jul20-112>

and 4th Gen Ryzen. Moreover, B550 cannot support 3rd Gen Ryzen APUs.

So which B550 board should you pick? Well, you should go with the age old rule of figuring out which features you want, list them in order of importance and get the board that checks all the boxes. Performance wise, using the 3rd Gen Ryzen processors on a B450 or B550 board makes nearly no difference. You'd assume that PCIe Gen 4 would impact the

processor performance but it doesn't go beyond 1-2 per cent. So you're better off not even considering B550 unless you want super fast storage speeds. That's where PCIe 4.0 really shines. Also, with storage, unless you are moving enormous amounts of data on a regular basis, it's prowess will never be put to the test. So you're essentially paying more money for no tangible benefit. Going by the feature listing is the only logical way. Since

B550 is the newer chipset, motherboard manufacturers will be including newer features and more storage connectors on them. So it'll be easier to get Wi-Fi 6 or 2.5G or 10G Ethernet within your budget on a B550 board as compared to getting the same on a B450 board since these features were premium back then. With this information in mind, I wonder what board my friend is going to pick. I'll keep you posted. 

BUYING ADVICE

LAPTOP FOR FPS AND RPG

Q Hi Agent001, I've been considering to buy Aspire 7 A715-75G(2020), as it looks like it provides a bang for the buck (Core i5 9th gen CPU, 8GB DDR4 RAM, NVIDIA GTX 1650 GDDR6 with 4GB of VRAM and 512 SSD) and also because it's on a 29% (i.e. INR 56,990 on the acer website) sale for some

Aspire 7 A715-75G(2020)

reason as of now. But I can't help but think that there may be a better deal in future, I need to know whether it will be a good decision to buy it or wait for a time to see if something better comes up as I wouldn't want to miss on some upcoming games just because I didn't have the hardware.

Looking at my usage I used Digit's buying guide from June's issue to consider a laptop.

I am a student and mainly I'll be using the laptop for some regular

work and playing some specific RPG titles and CS:GO.

Looking to hear from you soon.

—Ritansh Nand

A Hey Ritansh, There will always be a better deal if you skip this one and wait for a better one to pop up. The Aspire 7 A715-75G that you've pointed out is a pretty good configuration for the price that it has been listed. There are very few laptops that will have a 9th Gen Core i5 and an NVIDIA GTX 1650 with an SSD this large. Coming to the selection of games that you've mentioned, competitive FPS titles such as CS:GO are very optimised so they'll run well on most current and previous gen laptops without any problems. RPG titles, however, aren't built for competitive gaming so they're usually more graphically intensive and it really depends on which game you're playing. If you're looking at games like Assassin's Creed Odyssey then you'll get around 60 FPS at the highest settings on 1080p. Older games such as Diablo III which use an isometric view will end up giving you way higher FPS at the highest settings on 1080p. So don't bother waiting if you need a PC, this is a pretty good deal.

SLOW WI-FI ADAPTER

Q Hi Agent001, I'm Tarun. Please suggest some good mid-

range internal Wi-Fi adapter cards that could give good speed for downloading and gaming. I've tried the D-Link DWA-131 and TP-Link TL-WN823N but they both lack speed and show constant driver error. Thanks.

—Tarun Avatar

A Hey Tarun, If you're facing driver issues, then you really need to sort that out first before switching to another adapter. Who knows, you might face the same issue with the next Wi-Fi adapter that you buy or the one after that. A good way to check would be to use a Linux distro to see if the problem persists or not. That way you can rule out the Wi-Fi adapters from being defective. The other thing is that Wi-Fi performance is a two-way street. It depends on the Wi-Fi adapter you are using as well as the router which is serving it. You can't club an entry-level Wi-Fi adapter with a high-end router and expect excellent performance.

Once you've ruled out driver issues, you can see if your router supports MU-MIMO and switch it on if it does. And then get a Wi-Fi adapter that supports MU-MIMO as well such as the TP-LINK Archer T3U. Then you'll get better speeds since each device can use more than one data stream, especially when the network has more devices connected to it. 

TP-LINK Archer T3U
