

Off the grid

IKEA is implementing rooftop solar panels to generate all of its own power in stores across Australia. <https://dgit.in/jul20-37>

IKEA 2.0

The Swedish furniture giant made a failed foray into consumer electronics before, will it succeed this time? <https://dgit.in/jul20-38>

IKEA ENEBY and FREKVENSS speakers

FREKVENSS combo speaker

The FREKVENSS combo speaker features removable front covers, that are also actually present on the ENEBY speakers. The two-part speaker can be run via AC cable or by a separately-available battery pack. The

larger speaker of this combo can equip the exact same battery which can also power the ENEBY 8" while the smaller one can equip a battery also found on IKEA's automatic blind named FYRTUR. The interchangeability of batteries between devices from the company is actually pretty convenient.

The one with the woofer

The larger of the two speakers in the FREKVENSS combo is the woofer. After removing some screws, you can see connectors for power routing lying next to the breakout board for input and controls. You will also see the power converter and

the mainboard. As mentioned above, you can use the same 37.4 Wh battery pack as used on the ENEBY 8". The subwoofer consists of an array of chips including a microcontroller, an audio amplifier, a stereo A/D converter, and a power MOSFET.

The one with the bass reflex vent

The smaller of the two speakers in the FREKVENSS combo can be opened by unscrewing the compartment, yet again. The battery compartment here takes up a considerable amount of space and the bass reflex

vent is tucked on the right side beneath the speaker's driver. In between these two lies the breakout board along with the control knob. The back plate hosts the power supply, some AC routing and the motherboard. Chips such as a Bluetooth Audio Solution, an audio amplifier, an AH1834 IC, and a few others are found on the mainboard. The rear side of the board features some I/O options - AUX IN, AUX OUT and SUB OUT.
