

High tech fight against Covid-19

From drugs to delivery drones, how cutting edge tech is being used to tackle the pandemic. <https://digit.in/jul20-69>

AI discovered drugs

AI has proven itself time and again in the field of medicine, and is now being used to tackle the virus. <https://digit.in/jul20-70>

AI vs COVID-19

How AI is being used to fight the pandemic

Manish Rajesh | manish@digit.in

It's been said hundreds of times at this point, but COVID-19 has affected the world in a big way. We don't intend to give credit to the disease, but we're seeing some big advancements in technology and innovation around the world due to it. Organisations around the world are adopting these new technologies to fight the pandemic, and some of the biggest fields seeing mass adoption are AI and machine learning. So let's take a look at how AI is helping fight the pandemic and is possibly changing the future of healthcare.

MONITORING AND TRACKING THE DISEASE

Since the last large-scale pandemic, technology has grown exponentially. When before there was a shortage of

data, today it's a whole different story. Thanks to this abundance in data, it has become increasingly easy for AI to be able to track and monitor the crisis. Everyday, there are millions of posts on social media and online forums related to the coronavirus, which allows machine learning algorithms to provide near accurate information to officials to track the spread of the disease.

AI had also predicted the pandemic long before measures were even taken. BlueDot for example, a Canadian start-

up also using AWS, was one of the first to alert about the outbreak of the disease in Wuhan, China. It made its first alert back on December 31st, 2019, long before any official government bodies confirmed the same. The AI is capable of understanding up to 65 different languages, and goes through news reports from around the world to predict how the disease will spread. The information is then shared with health officials, to help them manage the risks.

Along those lines, machine learning is also helping researchers go through large volumes of data to analyse patterns in order to predict the spread of the virus, and hopefully take precautions against it. Researchers at the Chan Zuckerberg Biohub in California
