conscious of his actions and discourages mindless touching of the face.

The wristband also comes with a companion app that keeps track of your progress, allowing you to see if the number of touches per day goes down over time. The band basically works on the Pavlovian principle where the vibration acts as the negative feedback which could allow people to be conditioned to ignore the desire to touch their face.

such as commute, while the high strength mode allows proper ventilation even when you're jogging. The battery-powered fans last for about 3-5 hours and are rechargeable via USB. Lastly, the mask features a lightweight silicone seal that ensures that the mask

doesn't leave marks on the user's face and doesn't fog up the vision when worn with glasses.

KENT VEGETABLE DISINFECTANT

Fruits and vegetables' surfaces aren't very hygienic since they are displayed in open markets and are handled by multiple people. Microbes, soil, dirt, and pesticide residues can contaminate

the vegetables and fruits we consume on a daily basis. The novel coronavirus can last on several surfaces for hours or even days, however, it's still unclear if it can sit on the surfaces of vegetables and fruits. Nevertheless, to be safe from possible infection or other illnesses caused due to bacteria and dirt on vegetables and fruits, you can use devices such as the Kent vegetable and fruit disinfectant. The company claims that the device is an ozonator that can eradicate pesticides, bacteria, viruses and other harmful chemicals from the surfaces of fruits and vegetables. The device can be placed on a countertop or even mounted on a wall in your kitchen.

PURA-CASE

Pura-Case, designed by Carlo Ratti Associati, is an air purification wardrobe system that utilises 'ozone

treatment' to eliminate bacteria and viruses from clothes and also deodorise them, all without water. It looks like a fancy coat or suit cover within which you can accommodate up to four hangers and it comes with an air-tight zipper. The disinfecting system uses ozone

to allegedly eradicate 98 per cent of microorganisms, bacteria and viruses from clothes in just an hour. Pura-Case can also be operated remotely by using the accompanying app.

CONTACTLESS HAND SANITISER DISPENSER

Just like masks, hand sanitising has become a routine that is imperative in our every day lives at this point in time. The Defence Research and Development Organisation (DRDO) partnered with a Noida-based company, Riot Labs to develop a contactless sanitiser dispenser called Oakmist. Public sanitisers are often touched by multiple people, so the surfaces of the sanitiser dispenser can harbour infection. The Oakmist is a touchless dispenser that automatically sprays sanitiser when someone puts their hand underneath the device, sort of like an air dryer than often sits in public restrooms. With each spray, the dispenser gives out 5-6 ml of the solution

and the device can sanitise about 1,000 hands before needing a refill. Oakmist is currently listed on e-commerce sites such as Amazon, and offices such as the Rashtrapati Bhavan, Prime Minister's Office, Supreme Court and others are already equipped with it. 

the N95 mask's 95 per cent. The mask also comes with replaceable H13 HEPA filters that can be used for 150 hours before having to be replaced.

To combat excessive sweating, the Atmoblue comes with two high-speed, centrifugal fans with three adjustable airflow control settings that allow a fresh breathing environment. The light mode works well for light activities
