

Android Go mandatory

Google will force manufacturers to opt for Android Go on devices with low RAM, according to a leaked report. <https://dgit.in/aug20-47>

Adobe's camera app

Adobe is taking steps to make the camera app for your smartphone, including hiring Google executives. <https://dgit.in/aug20-48>

Using Nearby Share on Android

Learn how to use Nearby Share, the 'AirDrop' for Android

Dhriti Datta | dhriti@digit.in

G

oogle seems to be nearing the final stages of testing for its AirDrop-like file-sharing feature,

Nearby Share. There are reports indicating that all current Android users, running Android 6 or higher, could seamlessly get access to the feature over the air sometime in August. Google is also reportedly planning to bring support for this new quick-sharing feature to platforms other than Android as well, including Windows, ChromeOS, Linux and even macOS.

Since this is not an OEM skin feature, any Android device running Android 6 and above will be able to send and receive files from each other as long as the devices are in close

proximity. There's no extra setup and it is a one-click affair. Bluetooth is used to establish the connection between two devices while Wi-Fi transfers the data through its higher bandwidth. So, if you're itching to get your hands on the feature before it is officially released, you can follow this tutorial.

Note: Nearby Share is rolling out via Google Play Services beta. On the two devices we tested this on, we were able to get it up and running on one since it is not immediately available to everyone. If you are not able to get access to it immediately, we advise you to wait a few days and try again.

UPDATE THE GOOGLE PLAY SERVICES APP

If you want instant access to Nearby Share,

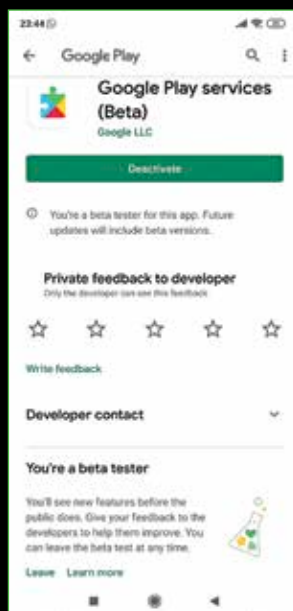

before the global launch, you can only get it through the beta version of the Google Play Services app. Weirdly enough, the Google Play Services app is notoriously hard to find through a regular search on the Play Store. So, here's the link that will take you directly to the Play Store page of the app – <https://dgit.in/PlayServices>. Once you've opened the link, scroll down and click on the 'Join' button under 'Join the beta'. Exit the page and then go back to the link again.

This time around you should see, a new version should be available as an update. Tap the 'Update' button. If you don't see the update button immediately, wait a few days and check again. Nearby Share is a server-side update, so all beta users won't get immediate access to it. Once the new update is installed, you can restart your phone.

ADD NEARBY SHARE TO YOUR QUICK SETTINGS TILES

Now, if you have received the update, you should be good to go to start sharing files or links via Nearby Share. However, you can first set up a few additional things to make the experience more seamless and integrated with your device. The first thing we'd suggest is adding Nearby Share to your

device's Quick Settings Tiles. Especially, if you're planning on using this feature extensively, it will be quite useful to have it handy in your Quick Settings tiles. Swipe down twice from the top of your screen to fully expand the Quick Settings menu on your device. Now, depending on the smartphone you have, tap on the button that edits your Quick Settings buttons. It is usually a pencil-shaped edit button on most phones, while Mi phones have a separate 'Edit' tile and Samsung phones need to tap the

Become a beta tester to use Nearby Share
