

Cinera Edge

Funding: US\$ 1,178,689 pledged of US\$ 10,000 goal

Link: <https://dgit.in/cinedge>

The Cinera Edge is a personal cinema HMD or head mounted display that features dual 2.5k micro-OLED and a Dolby Digital certified headphone with 5.1 channel surround sound. Considering the current situation and being unable to go out to the cinema to watch movies, this would be quite the gadget to have on hand. According to the creators, the Cinera Edge even tops the cinema experience, giving you a movie experience like no other. Furthermore, you're not restricted to just movies, with this HMD you can also enjoy your usual TV shows and even game on them, taking your immersion to the next level.

The Cinera Edge uses two micro OLED, or M-OLED, which is what gives it its small form factor. Each of the micro displays have a resolution of 2560x1440, use the same DCI-P3 colour standard that's adopted by most projection systems in movie theatres, and pack 3.6 million pixels. That's 7x more dense than the pixels on an iPhone 11's display. Furthermore, Cinera Edge also supports 3D, allowing you to watch 3D movies without needing to wear any additional glasses. Plus, no extra glasses means no need to deal with dimmer images.

Printpods

Funding: US\$ 128,798 pledged of US\$ 10,000 goal

Link: <https://dgit.in/ppods>

Printpods is a handheld printer by EVEBOT that can use a variety of different ink types and print on different types of surfaces. It comes from the same folk who successfully previously kickstarted the PrintPen, which was also a handheld printer.

There are three different ink types to choose from for the PrintPods – non-removable ink that only comes in black, which is your standard printer ink. Then there's a skin-friendly washable ink that comes in three colours, Navy Blue, Red, and Black. Finally, there's an invisible ink option that's only visible under UV light.

Thanks to the Printpod's design, you can use it to print on different surfaces, such as cloth, cardboard, wood, plastic, leather and, of course, paper. Switching ink takes seconds, it's as simple as pulling out the cartridge and replacing it. Furthermore, the Printpods can print on curved and rough surfaces as well. The accompanying app allows you to set up what you're printing and how you want it to look, adjust dimensions and so-on. It works with both iOS and Android devices.

Mokibo

Funding: US\$ 32,219 pledged of US\$ 20,000 goal

Link: <https://dgit.in/mokibo>

Mokibo is a full-sized attachable TKL keyboard for the iPad Pro. But that's not all, the keyboard's surface also doubles as a trackpad. In the previous version of the Mokibo, the entire surface of the keyboard was the trackpad, so that meant you had to stop using it as a keyboard entirely before using it as a trackpad. With the new Mokibo, only the right half of the keyboard is the trackpad, allowing you to continue

using some of its keyboard functionality while being able to use the trackpad feature as well.

They've accomplished this by having a touch sensor under the right half of the keyboard. They've also put in measures

to ensure that the device knows when you want to use it as a keyboard or a trackpad, so that you don't accidentally end up using the trackpad while typing.

The travel distance on the Mokibo's keyboard is naturally very less, owing to the design of the keyboard. It's not too different from the chiclet keyboards most laptops come with. All the usual trackpad gestures work on the trackpad half of the Mokibo, and it supports being connected to up to 3 devices via bluetooth. The device is not restricted to the iPad Pro, and will work with other devices as well. The Keyboard stand is made to fit and balance an iPad Pro though.
