With the launch of Windows 10, the operating system moved away from a paradigm that it introduced way back in 1985. Instead of regularly releasing new versions of the OS, which ranged anywhere from one to five years, Windows 10 was a commitment to keep updating and improving the same OS. This has turned out to be really beneficial to the end users, as the developers working on the OS at Microsoft are all on one single product, instead of being split into two teams, one maintaining the current OS, and the other building the next gen OS. This also means that there are a steady stream of updates, which improve the functionality and provide new features to the users. These major updates have settled into a twice a year cycle, with one update in the middle of the year, and another towards the end. The first update in the year drops in April or May,

with the second one coming in in October or November. As there are also smaller updates constantly being pushed, Windows no longer publishes long and detailed changelogs with all the changes, but instead short blog posts with the most important changes highlighted. It can be a bit of a task to keep up with all the changes, and that is where we come in. Here are a whole bunch of pro tips that will help you get the most out of your operating system. All these tips are geared towards improving the performance of machines, especially the low spec ones that might struggle under your typical workload, or increase your productivity, or boost the security of your device. For most of these tricks you don't need to install additional software, you only need to ensure that you have Windows updated to the latest version. While there are some registry hacks, most of the tips here should be easy enough for all our readers, irrespective of their familiarity with computers in general and Windows 10 in particular.
