

```

Administrator: Command Prompt - sfc /scannow
Microsoft Windows [Version 10.0.17134.286]
(c) 2018 Microsoft Corporation. All rights reserved.

C:\WINDOWS\system32>sfc /scannow

Beginning system scan. This process will take some time.
Beginning verification phase of system scan.
Verification 95% complete.

```

have to enter the following command before running System File Checker - `DISM.exe /Online /Cleanup-image /Restorehealth`. After this process is a 100 percent complete, run the following command - `sfc /scannow`. This command will scan all protected system files and will even replace corrupted ones with a cached copy. After the verification is a 100 percent complete, the scan results will be displayed. The result will say one of three things -

- 1) Windows Resource Protection did not find any integrity violations (no missing or corrupted system files)
- 2) Windows Resource Protection found corrupt files and successfully repaired them.
- 3) Windows Resource Protection could not perform the requested operation.

If it says that it couldn't perform the operation (option 3), then try and perform the System File Checker scan in safe mode.

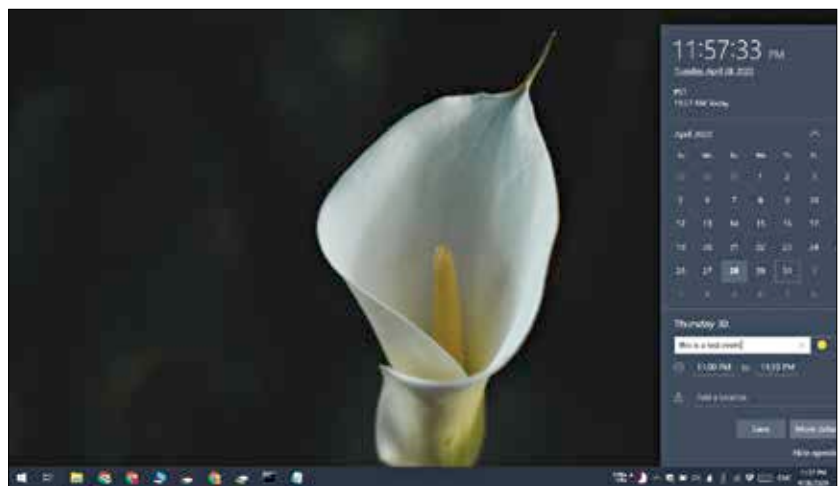

CUSTOMISE THE POWER USER MENU

The menu that pops up when you right-click Start or press **Windows + X** is usually called the Power User menu. While most users know of the existence of this menu, not everyone knows that you can actually customise it to your liking. To do this, download a small applet called Win+X Menu Editor from this link - <https://dgit.in/pwrusr>. Install it and then you can edit the three different groups in the Power User menu and even create a new group. You can add functions from the Control Panel or Administrative tools or even add specific apps.

MAKE THE TASKBAR TRANSLUCENT

If you're going for a neat and minimalist aesthetic on your desktop, making the taskbar translucent can add to the

vibe. To do this on Windows 10, you will need to download an app from the Windows Store called TranslucentTB. After you install it the taskbar will turn translucent, and you can even go ham and customise the appearance of the taskbar by tweaking around the colour and effects.

OPEN WEB FILES WITHOUT SAVING

Here's yet another lesser-known trick on Windows 10. Did you know that you can copy-paste a web address into the Windows file/open browser? This allows you to open an image or PDF and view it without saving it onto your PC first. So, say you want to edit an image you found online on Photoshop. Instead of downloading it and then opening it on Photoshop, you can copy its URL, open Photoshop, click on **File > Open** and then paste the web address into the File Name bar. Now, the photo will open automatically on Photoshop and you can begin editing it and then save the actual finished product. You can do the same with PDFs (open in Acrobat) and other files.

CREATE EVENTS WITHOUT THE CALENDAR APP

Windows Calendar is a neat way to keep track of your events and

schedule and organise your day in general. However, needing to always open Calendar to add events can be a prove to be a bit tedious. Fortunately, you don't need to open Calendar in order to create events, you can just do it directly from your Taskbar. That's right! To do so, simply click on the box with the time and date on the right corner of your taskbar. Click the date you want to schedule an event. Enter a name for the event, and you can also add time and location here. Click save. That's it, you're done! The event should now appear on your Calendar app.

OPEN ITEMS ON TASKBAR WITH KEYBOARD SHORTCUTS

We've all got our most used apps pinned to the taskbar, be it our browsers, or simply to open windows explorer. You don't have to click on the icons in the taskbar in order to open them. Instead, you can simply use the keyboard shortcut, which is the **Windows key + the relevant number key**. The number key here corresponds to the position of the app on the taskbar, with 1 being the first app on the taskbar from the left. So Win key + 1 would open that app.

GET RID OF START MENU ADS

If you're running Windows 10 on default settings and haven't really tweaked around with it a lot, then you've probably noticed that when you open your start menu, you often get what Microsoft calls
