

Star Wars planets ranked

The Star Wars galaxy offers a ton of habitation options, so here are the best planets, ranked. <https://digit.in/aug20-101>

Dark City concept art

Check out the portfolio of Peter Pound, including concept art and storyboards made for Dark City. <https://digit.in/aug20-102>

FICTIONAL CITIES

Don't pack your bags, as these are the places that you cannot put on your bucket list. They unfortunately exist only in fiction, and make their citizens live in all kinds of ridiculous situations. Their charm is that they all somehow manage to work, and all have their unique culture and heritage. They are more than just concrete jungles peppered with neon lights, even though they serve as mostly pretty backdrops for the action.

Asgard

This is the city of a futuristic civilisation mostly based on "wormhole crystals" that allow the inhabitants to teleport anywhere in the universe. This technology has the unintended consequence of inviting incursions by Dark Elves, Frost Giants or Fire Demons. Life is pretty good in Asgard, with cutting edge technology as well as an abundance of resources.

Dark City

If you are one of those people who likes to stay up at night, this is the ideal place for you as the sun never rises here. Every single day is a novel experience as you get a reset of all your memories. The buildings and layout of the city keeps changing by massive underground machines. If you do not mind volunteering for an experiment by advanced aliens, go here.

Bioship

This is a derelict ship in the Oort cloud from a civilisation that created a generation ship to colonise the stars, but then lost its propulsion system. The inhabitants unfortunately have lived for generations without knowing about the existence of stars, and are unknowingly headed right into the gravitational embrace of a star. The good news is that the weather is always pleasant.

Diaspar

In Arthur C Clarke's *The City and the Stars*, Diaspar is the last city on an Earth a billion years into the future. All the humans are manufactured from gene banks, and the tech is appropriately advanced, including fluid roads that are conveyor belts faster in the middle than the sides, vehicles not required. Life here is a bit depressing though, as there are no weekend getaways.
