

KFC lab-chicken nuggets

KFC is working on producing the world's first laboratory-produced chicken nuggets, which is a part of its "restaurant of the future" concept. To that end, the company is working with Russian company 3D Bioprinting Solutions to develop bioprinting technology that will essentially "print" chicken meat, using chicken and plant material.

KFC will provide Bioprinting with all the necessary ingredients, such as spices and breading in order to acquire the "signature" KFC taste. The goal is to seek and replicate the taste and texture of genuine KFC chicken.

Since the Bioprinting firm will be using animal materials as well, this is most definitely not vegetarian. However, KFC does have vegetarian options in many locations, India being one of them. According to KFC, bioprinted nuggets would also be more environmentally friendly to produce than standard chicken meat. This is according to a study in the American Environmental Science and Technology Journal. According to the study, growing meat from cells would reduce greenhouse gas emissions and energy consumptions as compared to traditional methods.

Kamp C 3D printed house

We've all seen 3D printing being used to make some incredible things. But these things are usually pretty small. However, in Belgium, Europe's largest 3D printer was just used to 3D print a whole two-story house!

While houses have been 3D printed in the past, this two floor house is one of the most ambitious 3D printing projects to date.

A 3D printer from Denmark-based company, COBOD, was used for the project. The project itself is called Kamp C.

For the project, COBOD's prototype BOD2 printer was used, which is pretty much like usual 3D printers in the market, only, on a much much larger scale. We're talking 32x32 feet here!

For the materials as well, it uses concrete, with the concrete, silo and mix/pump installation being supplied by Weber.

The house itself is pretty impressive, including many features, such as solar panels and underfloor heating. Roofs and doors were added to the house manually, and not printed along with the house.

At 980 sq ft it isn't exactly the biggest of houses, but it's an achievement nevertheless.

LEGO Nes

Nintendo and Lego have teamed up to make a Super Mario platform game, with a twist, okay well, not really a twist. The game's made out of Lego bricks. That was expected really.

The brick-build Nintendo NES and TV comes complete with a mechanical scrolling Super Mario on the screen. The set includes an NES console with one controller, along with a game cartridge that fits into the slot. Also, there's a little retro TV set, inside you which you have a part of a level from Super Mario Brothers. There's a little handle on the side of the TV, which you can turn and watch the level scroll by as Mario does his thing. This kind of mechanic is not something usually seen in Lego, it's interesting stuff. Of course, the whole thing in general is pretty neat.

This one is naturally targeted at adults, however, there is a just-for-kids set as well. If you have the Mario from that set, you can put him on top of the TV, and he'll make the sound effects for the 2D Mario on the TV 'screen'!

This 2646 piece set goes on sale starting August 1, and will retail at \$229.
